Foreword

This second volume of Longchenpa's Trilogy focuses on the specific practice of Dzogchen meditation. Traditionally, such a text is meant to be an outline or synthesis of an enormous depth of teachings which are difficult to express verbally or conceptually. These teachings, therefore, are not ordinarily practiced without an explanation of the words and symbols by a teacher in the 'lineage', and only after thorough study does a person receive additional instruction and guidance in the meaning and application of the text. This oral instruction is essential because it 'completes' or 'finishes' the text and properly initiates the student into its practice. Therefore, it is very important for the person to listen to the instruction carefully, to think about what he has read or heard, and then to realize the teaching through his life.

Texts of this nature have three levels of explanation — outer, inner, and secret. The first level is the direct or literal interpretation of the text called lung; second, the word-for-word commentary of specific meanings and connotations called khrid; and third, the initiations, or dbang. The lung, or
texts, explain the correct procedure for performing the practices and guide the individual through the proper patterns of development—how to visualize the mandala or perform the sadhana, and how to work with difficulties encountered within the practice. This initial, theoretical preparation is followed by khrid in which the teacher may give the student certain exercises or specific ‘tests’ to see how much he understands and how far he can proceed with the practice in his own experience, and to determine whether or not the student is ready to receive further instruction. If the ‘test’ is successful, then certain oral teachings may be given in a more direct manner. There are also many different kinds of dbang or initiations—various explanations, symbolic expressions, gestures, and visions through which the meaning of the teaching is directly and inwardly realized.

Each text, therefore, contains a map, or specific instructions for becoming enlightened. But first, at the preliminary, psychological level, it is very important to clean up mental or emotional blockages and to prepare the soil for the understanding to grow. Basically, as human beings, we have many different intellectual and emotional patterns, and we become ‘fixed’ in certain ways of seeing and behaving. The Vajrayana has many methods to liberate karmic obscurations—not necessarily through analysis or investigation, suppression or confrontation, but through certain inner ‘initiations’ or ‘cleansings’. Without this cleansing of our psychological confusions, it is not possible to understand the deeper, more hidden teachings.

The main purpose of all Buddhist teaching is to experience its truth for ourselves—to see clearly and to directly contact our own inner understanding. So it is possible that a person who is seriously practicing one text or one meditation can achieve Enlightenment. But commonly, human interpretations are very limited, and certain kinds of knowledge or inner experience are difficult to understand without guid-
ance. Like the sun and its rays, the thread or key to Enlightenment is continuously being transmitted through the inner guidance of the living lineage. So the person who follows these instructions—beyond verbal explanations and symbols—can completely trust them until he realizes the teachings within his own awareness. This is how the 'lineage of direct realization'—or the Nyingma Dzogchen lineage as represented by Longchenpa—has continued to survive for many centuries.

For many Westerners, the Buddhist tradition may often seem complex and difficult. Everyone would like the teachings to be explained very simply. But, while words and concepts can be useful, they are not sufficient. As with a good meal, we eat and walk away satisfied, but soon we are hungry again. So certain teachings may seem complicated unless we are ready to hear them on a more inward level. That is why the Nyingma tradition has always emphasized study and practice together. Once we become more familiar with Buddhist concepts, we realize that intellectual explanations and philosophical theories originate in direct experience. So read these words by Longchenpa very carefully and think about them. Each word and image seems very important.

Once again, I am deeply grateful to Dr. Guenther for continuing his efforts to present this important knowledge to Western readers. Even Tibetans may feel that this text is extremely difficult to translate because it is based on very deep meditative insight. However, I personally feel that the heart of Longchenpa's message is quite clear, and that anyone who reads this translation will find something of great value for his or her life.

The Tibetan tradition has many excellent and beautiful texts. In five or six years we have tried to make a few publications available through Dharma Press, and in the future, as more students learn Tibetan, we hope to present many more volumes and to extend the teachings of Buddhism and the
Foreword

Nyingma lineage to anyone interested in developing his own potential. By the merit of these positive actions, may Longchenpa’s teaching and Padmasambhava’s blessing help sentient beings everywhere to overcome frustration and wake up to Enlightenment.

TARTHANG TULKU RINPOCHE
In recent years meditation has gained considerable publicity. The inevitable result of the accompanying propaganda has furthered a widely held belief that any, if not a particular, brand will 'do the trick' irrespective of the person who uses it. Klong-chen rab-'byams-pa’s dissertation on this controversial subject comes as a timely corrective because he re-instates the centrality of man, on whom everything depends. He does not prejudge man, but sees each individual involved in a process of growth, a process which does not take place in isolation or a vacuum, but in an environment which creates and molds man as much as it is man’s creation. Since whatever man does has wider implications, it must be permeated by a sense of direction which ultimately is rooted in the knowledge of ‘where’ he is going and of ‘what’ he is becoming, which is merely the manifest expression of this knowledge.

‘Meditation’, for Klong-chen rab-'byams-pa, is thus not an end in itself, but a unique device for tuning in to a reality which man is constantly—actively and creatively—shaping.
Any device has the tendency to become an end in itself, but, seen as something dynamic, it furthers understanding and action to aid us in orienting ourselves and providing us with insight and direction. The moment we take a step in a certain direction we have already gone beyond ourselves so that we are no longer some static, pre-defined essence, but are participating in an evolutionary process of growth which leads to further, greater, and wider complexities. What may have been exclusively valid on one level loses its exclusiveness on the next higher one, and is superseded by a higher-order comprehensiveness; if this were not the case there would be no growth but mere stagnation.

For this very reason Klong-chen rab-'byams-pa is very critical of facile ‘cure-all’ prescriptions. What he wants us to do is to take the ‘big jump’ that sets us free from a preoccupation with mere ‘techniques’ and other props which are the stock and trade of the person of ‘low intelligence’, who is particularly prone to aberrations and excesses. In order to grow, to be able to take the ‘big jump’, we must look forward and learn to tune in to what, from one viewpoint, lies ahead and, from another, emanates from a higher level. In this phase of our being, ‘imagination’, as the ability to devise fresh models for the disclosure of the meaningfulness of an ultimately ‘intelligent’ universe, is of paramount importance, although it must not be used as an end in itself.

As in part one of the Trilogy, Klong-chen rab-'byams-pa has structured each chapter in this work in a distinct manner. In indicating this structure I have followed the same principle as in the first part, but have simplified the very intricate pattern of the third chapter in accordance with Klong-chen rab-'byams-pa’s commentary. His own structural analysis in the rDzo-pha chen-po b5am-gtan ngal-gso’i bsdus-don Pung-dar-ka’i phreng-ba makes almost every line a topic in itself.

Because of the highly technical nature of this dissertation, I have used Klong-chen rab-'byams-pa’s other writings extensively in order to give the Western reader some insight
into the depth and scope of rNying-ma thought. Here, as in so many other cases, I gratefully acknowledge the help given me by my friend Tarthang Tulku who has always been concerned with having the wealth of rNying-ma thought and its application in life available to a larger audience.

I am grateful to my colleagues and friends, professors Keith Scott and Leslie Sumio Kawamura, and Mr. Steven D. Goodman and Mr. Stephen Tainer, for critical comments; and above all, to my wife for her sustained interest and unflagging patience in preparing the final form of the manuscript.

Finally, I have to thank the editorial staff of Dharma Publishing for their careful work on the typescript, Miss Judy Robertson for designs, Mr. Kennard Lipman for his assistance in proofreading, and Mr. Paul Clemens for the preparation of the index.

Kindly Bent to Ease Us
The second part of Klong-cchen rab-'byams-pa's Trilogy of Finding Comfort and Ease is the shortest and most technical, and yet in its conciseness, which at first glance may seem enigmatic, it contains a wealth of observation and information not readily accessible elsewhere. Its theme is 'meditation' (bsam-glتان) in its specific rDzogs-chen connotation. The English term 'meditation' has been much abused in modern usage, commercially and otherwise, yet its original and basic ambiguity, apart from the noticeable abuse and misuse, still has a certain heuristic value. In its transitive use it implies a definite directing or focussing of thought and, in this sense, it approximates the ideas of intending and purposing. It also connotes persistent concentration of attention. In its intransitive use it suggests an effort to understand a thing in all its aspects, values, and relationships, but even in this sense, the transitive application reverberates in its intransitive one.

The Tibetan term bsam-gian corresponds, to a certain extent, to the transitive use of the English word 'meditation',
particularly because it constitutes an aspect of what is to become the noetic-noematic complex \((\text{sems})\), usually rendered by 'mind' or, more actively, 'mentation', and referring to the process of consciousness dealing with a specific object. Its most generic feature is that it is 'intentive' to objects, that is, objects are eventually 'intended by' the process of consciousness, which we associate with a 'subject', a reflective ego. Inasmuch as these 'objects' to be intended by consciousness have a certain meaning for and through consciousness, they point to certain sets of modes of consciousness (as process) which have these specific objects as their correlates. The term \(\text{bsam-glian}\) applies to this 'setting' of an as yet preconscious intending, which gradually becomes frozen into the customary subject-object division, on any level where the noetic-noematic correlation is in its formation.

Inasmuch as emphasis here tends to be laid on what is to become the reflective-thematic aspect of experience, more and more engrossed with explicit reflective discrimination, this 'setting' is already a kind of limitation of the open dimension of Being. In terms of cognition, this open dimension of Being is 'pure awareness' \((\text{rig-pa})\) which, in itself, as the ever-present pre-reflective non-thematic aspect of experience, remains a free 'bestowing of sense', Buddhahood intentionality \((\text{dgongs-pa})\).\(^1\) \(\text{bsam-glian}\) and \(\text{dgongs-pa}\), although distinct from each other, indicate structural directions and deployments within experience. To be more precise, \(\text{bsam-glian}\) characterizes the moment of transition when the latent discriminating determinations, that become an explicating and concentrating attention, begin stirring and are going to move freely in the context of explicit themes such as subject and object, whereby they harden into 'mind' \((\text{sems})\). This particular transitional moment within experience is termed the 'spontaneous' or 'self-present' or 'natural' setting. In picturesque language Klong-chen rab-'byams-pa declares:\(^2\)
Here, in this palace adorned by a display of spontaneous richness,
The king, self-existing pristine cognitiveness, sits on his throne.
While all the creative impulses of pristine cognitiveness,
present as the coming and going (of thought),
Have become ministers and govern the country,
The noble queen, a self-present setting, and
Their son with his servants, self-manifested Buddha intentionality,
Have gathered in the midst of pure pleasure, radiant in themselves, without dividing thoughts.

He elaborates on this verse as follows:

Here, self-existent, spontaneous pure awareness is the layout of a palace; in it all meanings are complete inasmuch as ‘founding strata of meaning’ and ‘founded pristine cognitions of meaning’ are such that they cannot be added to nor subtracted from each other. As is stated in the Yi-ge med-pa:

Since in me there is neither without nor within,
Lucency is perfectly complete;
Since in me there is neither no-thing-ness
nor some-thing-ness,
Presence is perfectly complete.

Thus, the very facticity of the spontaneously present vitalizing power of Being is self-existent pristine cognitiveness, like a king who does not leave his throne. The self-present actual setting within this facticity is like the queen, because it has never been experienced apart from pure awareness. The warmth of Buddha intentionality, that is there in its own right, once one has understood what is meant, is like the prince and his servants. The cognitive capacity that goes out to its objects, a self-creative movement that comes from the reach and range of pure awareness, is like the ministers who govern the country and provide the necessities.

If one does not make this distinction one would be no different from a drunken person talking nonsense. Hence one
must know that, within self-existent pristine cognitiveness that has been and will be forever, self-present and spontaneous facticity is independent of (any) object, and that the pristine cognitiveness—which, as a creative movement performing the act of cognition, emerges in the direction of an object—depends on the object. Since there is a great difference between the conditions that lead to a state of dividedness if one is not aware of the (original) relaxed state and that which is there in itself, it is by recognizing the self-existent (character of pristine cognitiveness) within, that its creative movement becomes free in and on its (very) ground. This is said to be the reach and range of primordial purity where all (contrived) meaning has ceased.

Since the creative movement with its divisiveness enters the object by (going away from) the indeterminate aspect of the self-existent (pristine cognitiveness)—if the latter is not recognized for what it is—it is important to recognize the Buddha intentionality that does not admit of any break, together with the actual (self-present) setting. Facticity and specification are discussed in the Kun-hyesi as follows:

Listen, O great being:
Pristine cognitiveness which is called pristine cognitiveness
Is cognitiveness since all beginning;
It is self-existent, cognitive since all beginning.
The pristine cognitiveness that conceives of an object
Derives from the object and is not self-existent;
In the mere absence of an object it is not illumining.
Therefore, the self-existent pristine cognitiveness
is a pristine cognitiveness that is cognitive since all beginning.
This is what is meant by pristine cognitiveness.
The pristine cognitiveness that is the teacher of the entourage
Is a pristine cognitiveness that discriminates between objects.
This discriminating between objects
Is a pristine cognitiveness that performs the act of cognizing,
Because the object that is being cognized
Derives from the mind in limpid clearness and consummate perspicacity.
This mind in limpid clearness and consummate perspicacity in which no object obtains
Derives from pristine cognitiveness itself, hence
There is no imaginative activity with holistic experiences.
Tendencies towards holistic experiences are not engendered.
This very meaningfulness in which no tendencies are present
Is said to be the intentionality of all the Buddhas of the three times.
The intentionality of all the Buddhas of the three times is not divided as to objective (content).
It has remained the same since beginningless time.

Within this self-existent pristine cognitiveness that is not divided as to objective contents, the very spontaneity, uncontrived, of the self-present setting is the meditative setting for those who tune themselves in to a higher reality, while inner calm and wider perspective that focus the (ego-bound) mind on an object are the (meditative) setting for worldly simpletons. The difference lies between building up or not building up tendencies. The self-present fact of pure awareness, which is mind in limpid clearness and consummate perspicacity, is termed 'meaningfulness-(directed) intentionality'. The cognitive capacity that rises in the direction of objects is termed 'samsaric mind'; it is born in the form of noetic (grasping) and noematic (content). Furthermore, when there is the cognitiveness of relaxation in the reach and range (of self-existent pristine cognitiveness) after it has been recognized for what it is, the creative movement of the self-existent cognitiveness subsides in its very ground, and intentionality becomes pure meaningfulness. Since these two ideas are quite different, the Kun-byed again says:
Listen, O great being:
In the spirituality which is the self-existent pristine cognition
Of all the Buddhas of the three times,
There has, since the very beginning, never been any dividedness.
This cognition as such does not enact Buddha intentionality.
It is separate from any object (belonging to) dividedness.
If any person who tunes in to a higher reality in any way Changes over to a state where no dividedness obtains,
He enacts Buddha intentionality.
Since self-existing pristine cognition is not divided as to objective (content),
It is not shrouded in the tendencies towards dividedness.

The upshot of this lengthy discussion is that both bsam-gtan and dgongs-pa constitute an existential cross-section, both interpenetrating in such a manner that two directions can be followed. In one case, the movement is in the direction of reflective discrimination, though it is not reflective discrimination itself; in the other case, the movement will not be disturbed by reflective discrimination. Nonetheless, both movements are tendential in character: the one (bsam-gtan) is orientated towards thematic concerns, the other (dgongs-pa) towards a non-thematic range that conveys immediate felt meanings tied up with a totality field. At the same time a hierarchical order is implied—dgongs-pa encompasses bsam-gtan, not the other way round.

As a 'setting', bsam-gtan is built into the psychophysical organization of the human individual and, specifically, points to the contemporaneity of a prereflective self-referentiality, which becomes noticeable in the birth of a decision or the execution of an action, with the project or action to be embarked upon. The prereflective self-referentiality is pointed out in Klong-chen rab-byams-pa’s statement that
(This natural setting) may suddenly stir and be aroused from its mere thereness in all living beings when the cognitive capacity begins to vibrate in its dormancy. It is that which exists in the eyes of an arrow straightener, in the eyes of a hare and a hawk resting in its nest, and so on. In brief, it exists whenever consciousness is roused from its dormancy.

It is then, with the conscious execution of a project, that the ego (or self) develops in such a way that it remains within, and ‘inhabits’, as it were, the action. It is never prior to the action; it discovers itself in it. In other words, bsam-gtan is something like a symbiosis of actor and action. The important point to note in all these instances is that the ‘agent’ or person who ‘meditates’ is an integral factor in this process. The agent apprehends (and enacts) his intentions in definite perspectives (sems) which are his finitudes. At the same time, however, any such finitude is an openness (byang-chub sems), and the agent, therefore, is not riveted to only one specific perspective or situation. The agent is able to appreciate perspectives other than the one he is deploying at a given moment. In view of the fact that the agent is an integral factor within the ongoing process, it is significant that bsam-gtan is said to be characteristic of ‘ethical man’ (Bodhisattva, byang-chub sems-dpa’) because he is one whose mind (sems) can, and is about to, become open to limpid clearness and consummate perspicacity (byang-chub) whose resonance (dpa’) shows itself in ‘ethical man’s’ mind (sems). It is basically a mere continuation and variation of this ‘setting’ when it is said to be operative in those who have reached the various spiritual levels.8

However, ‘ethical man’ whose ‘setting’ is marked by being a more coherent (equilibrium) structure which can serve as a stable basis for later processes—it can ‘lead on’ and, hence, is unlikely to ‘peter out’—is only a step in the evolutionary movement as exemplified by man. Three such evolutionary phases can be distinguished. The lowest level is the one represented by ‘gods and human beings’, gods being
Introduction

analogues to human beings, a great deal more powerful, but not necessarily morally superior. The next higher phase is that of ‘ethical man’ who has risen above the crowd and above the mass individual (who is torn and divided by passing whims). ‘Ethical man’ is concerned with norms which make a person tune in with a life-stream, and the highest or optimal phase is the one of Buddha intentionality. Each of these phases involves a kind of insight which is then pursued as the purpose in and of life through the exercise of creative imagination. Thus, in the *Nyi-ma dang zla-ba kha-sbyor-ba chen-po gsang-ba'i rgyud*, we read:

Pursuit of life’s meaning is threefold: (purposive) concentrating of mind as is done among gods (and men); the (coordinate) setting in Mahāyāna; and the intentionality of all the Buddhas throughout the three aspects of time.

Similarly the *Rig-pa rang-shar chen-po'i rgyud* declares:

Pursuit of life’s meaning is pointed out to have three (phases):  
It is claimed to be concentrating mind (*sams-dzin*) as done by gods and men;  
The (coordinate) setting of ethical man (*byang-chub sams-dpa'i bsam-gtan*);  
And Buddha intentionality (*de-bzhin-gshegs-pa'i dgongs-pa*).

The same text also makes it quite clear that the ‘setting’ of ethical man is not a preoccupation with mind which——on the previous level is taken to be one entity among others and through whose cultivation a state of non-dividedness is temporarily achieved——remains one among many other entities in a basically dualistic mind-body separation. Rather, the non-dividedness of the ‘setting’ is spontaneous as it is embedded in and emerges out of the evolutionary stream, a stream not admitting of any dividedness in itself. But still, while on the lowest level we may deal with mind as an object in a detached way, and on the level of ethical man by being
more deeply involved and more firmly rooted in non-dividedness, both levels are stratifications within the evolutionary process as a whole, which at its peak is likened to the open expanse of the sky. The hierarchical relationship in terms of 'non-dividedness' is such that the level of 'gods and men' is encompassed by that of the 'setting' of ethical man, which, in turn, is encompassed by Buddha intentionality. Hence, as the Rig-pa rang-shar chen-po'i rgyud states, the lower level cannot bring forward, or set forth, or reveal the higher level although the higher one can do so with the lower ones by giving increased meaning and order (non-dividedness, non-randomness) to them.

In the light of this interpenetrating hierarchical order, differences in procedures (rather than in states) become similarities of increasing complexities. We must never forget that man's life is not something static but a continuous movement towards higher, more complex, more-informed universes of meaning acted out by the human individual, not so much by anticipating and straightforwardly realizing them, but by letting the higher levels define themselves. Maybe, only on the lower level—'gods and men'—is there control by mind of mind and body. On this level the person conceives of himself as having a body and a mind. He then feels that something has to be done about the situation in which he finds himself and therefore attempts to concentrate, but his concentration is on something or other, be it on the sensory objects or on an idea. Thus, one of the most important and helpful aids to concentration is deep breathing which prevents mind from wandering, at the same time making the person aware of the forces within him, flowing smoothly and pulsating rhythmically, but also charging him so that he 'glows' with vitality. Gradually a mental situation, such as a pure sensation of colors, sounds, and so on, develops, which may be termed an objective non-referential situation, that is, one having no epistemological object. Thus there are three major phases:
1. steadying the mind,
2. disengaging it from its beliefs in (and identification with) concrete entities, and
3. pure sensation.¹³

But, as the *Rig-pa rang-shar chen-po'i rgyud*¹⁴ clearly states, this concentration is but a temporary phase and has little to do with the overall or finalistic approach: It remains, despite its being an ‘objective’ situation, a ‘subjective’ affair.

This concentration of mind by mind as practiced by gods and men
Is such that, when breathing by mouth and nose has been regulated,
The subjective mind, no longer moving to and fro, there being no divisive forces,
Is the cognitive capacity having become focussed.
This is declared to be a temporary non-referential situation.
It cannot reveal what is the ultimately real point.

Restating this rather technical presentation in simple language we may say that in being concerned with a temporarily induced state of pure sensation we miss out on the larger issue of life and growth.

To a certain extent the same situation applies to the next higher level, the ‘setting’ of ethical man who quite literally is ahead of ordinary men and their analogues. The ‘setting’ is there before the dichotomic mind (the noetic-noematic complex, *sems*) dissolves the unity and is caught in its dividedness. Therefore, this ‘setting’ cannot be controlled or commanded by the lower level ‘mind’, which, because of its generally dissociative character, is unable to hold a complex pattern of thought stable. It is this ‘setting’—by virtue of being a higher-level organization and having a greater capability of providing stability as a basis for further complex processes to take place—that is able to do what ‘mind’ cannot do. Still, this ‘setting’ is of a low hierarchical order, although higher than the level of ‘men and gods’, and be-
cause of this fact it is not the final stage. Thus, the Rig-pa rang-shar chen-po'i rgyud\textsuperscript{13} declares:

Ethical man’s setting
Is not some concentrative controlling by the mind.
It comes naturally or spontaneously.
When one avails oneself of it, a dynamic wholeness is evolved.
Also, thoughts about food are dismissed.\textsuperscript{16}
It is deployed by those on the higher spiritual levels.
Naturally there is no divisive referentiality.
But even this setting is unable to reveal what is the ultimately real point.

For, as Klong-chen rab-byams-pa explains, the real issue is the overarching ‘pure awareness’ (rig-pa), sheer lucency (‘od-gsal), not just a mere non-referential situation.

Although both levels are alike in being inadequate, while they are different in status insofar as the ‘lower’ one is temporarily induced and the ‘higher’ one is a more or less stable and permanent setting, what they again have in common is a non-reflective (non-dissociative, non-divided, non-interfering) attitude. Precisely through such an attitude, access to the life-stream’s own origin is made possible, and the unity with the wholeness of meaningfulness is reestablished. It is tempting to speak of it as an ‘inner’ way, but actually it points beyond a ‘within’ and a ‘without’ towards something deeper which we cannot, without lessening its significance, label in any way. Because of this feature, our ordinary concepts, geared to a discriminatory state of affairs, are inadequate, if not misleading, and can be used only with the greatest caution.

The access to the life-stream opened up by the non-reflective, non-dissociative attitude is referred to by such terms as ‘control centers’ (‘khor-lo) and ‘conductors’ (rtsa), which themselves are features, rather than separable parts, of a larger ‘field’ that is dynamic through and through. This is borne out by such statements as
Where there are 'conductors' there also is 'motility', and wherever 'motility' extends there also extends the 'bioenergetic input'. The latter is twofold: 'bioenergetic input triggering morphogenesis' and 'bioenergetic input remaining the energizing force'.

And,

The basis of the living body is the triad of 'conductors', 'motility' and 'bioenergetic input'. Both 'conductors' and 'motility' fall under 'bioenergetic input'. The bioenergetic input that triggers morphogenesis is the radiative energy (spectral frequency) of the four 'elemental forces'. They are the site for 'pure awareness'. (All of this) is indivisibly present.

And,

Although the body as a force field is shown to have this triad of 'conductors', 'motility' and 'bioenergetic input', actually it is not found as something different from the pure fact that is the one pristine cognitiveness.

Our living body, our concrete existence, is a total field that is both derived and primary, and inasmuch as the 'conductors' and 'control centers' are found in the immediacy of the awareness and realization of the dynamic character of the life process, they put the focus back within. We can understand these 'control centers' and 'conductors' (or, to avoid any static misconceptions, 'flow-patterns') as indicating complex spatio-temporal configurations or structures together with regular arrays of substructures, setting up and being set up by circuits. They are thus the expression of an orderly process, and each stage or phase in this process is something like a cross-section through a spatio-temporal pattern. Whether we see this configuration as structure or as process, it remains physical and psychic at the same time—physical in the sense that it can be 'observed' and psychic in its being 'lived'. A further significant feature of
this spatio-temporal configuration is its symmetry which is radial in the ‘control centers’ and bilateral in the ‘conductors’, the latter exhibiting right-handed and left-handed twists. Since right and left are reversed in what is to become a ‘female’ organism, psychological and physiological differences are functionally determined. Both right and left have significance for and aid cephalization whereby the central axis is polarized into an anterior and a posterior end with a growing emphasis on the ‘head’.

There are four ‘control centers’ of varying radial complexity, which emerge against the background of an utter openness—the open dimension of Being (in philosophical terms) or the immensity of space, the vastness of the clear sky (in sensuous terms)—which nevertheless reaches into the ordered whole presented by a human organism. Klongchen rab-'byams-pa says of these four ‘control centers’ in a summary fashion:

Thus, there come from among the four control centers first the ‘navel’, because it sets up the overall foundation of the body and what goes with it; then comes the ‘heart’, the memory storage, because the cognitive capacity (‘intelligence’) has set in; then comes the ‘throat’, the nutriment, because the relishing of the flavor of the cognitive processes is verbalized; and last comes the ‘head’, the top ordering capacity for the whole.

Accordingly, when his elaboration of this process is presented in concise form, the first ‘control center’ to develop is termed ‘initial generator control center’ (skyed-byed dang-po’i ‘khor-lo), because it initiates the programming of the manifold actions and emerging functions of the living organism in such a way that it will reach the form and functioning characteristic for the organism, be this, in the case of a human being, either a man or a woman. In the development of this ‘control center’ the process of synthesis (chu, ‘water’, ‘cohesion’) is primary. It is ‘located’ in the ‘navel’ (lte), which is the
'center' of the process in the sense that it becomes centered in itself and, by virtue of being a process, 'centers' itself between adjacent levels.

The next 'control center' in ascending order is termed 'memory storage control center' (dran-pa 'dus-pa'i 'khor-lo). It is marked by the primacy of gravitational forces (sa, 'earth', 'solidification') which are necessary to prevent the escape of what may be said to include all that we have learned in the struggle for survival, and to retain this 'knowledge'. It marks the beginning of 'intelligence' (shes-pa). Therefore, it also plays a significant role in the duration of the organism's life. It is 'located' in the 'heart' (snying-ga), which is the 'center' for all that we have split into mind and emotions. In splitting these we have made them quite inadequate as a means of dealing with our self-imposed problems.

The third 'control center' to emerge is called 'nutrition storage focal point' (ro-rnams 'dus-pa'i 'khor-lo), in which metabolic processes (me, 'fire', 'combustion', 'temperature', 'heat') are predominant. It is 'located' in the 'throat' (mgrim), which can easily be associated with the monitoring agency in the process, and thus is significant for the organism's well-being, health, and capacity for enjoyment and intercommunication (longs-spyod), involving the internal as well as the external environment.

Lastly, topping all these 'control centers' is the 'top ordering system control center' (rtsa-mo rnam-par bkod-pa'i 'khor-lo), which is 'located' in the head (sphyi-bo), the 'top' in a living organism, bearing the eyes and other sensory organs. In this ordering, 'speed' is of primary importance, and hence it is related to 'motility' (rlung) which is needed to maintain the complexity of the whole 'system' which, in turn, requires 'motility' for efficient working, in particular, for working out the details for which the 'system' has been programmed. This 'control center', therefore, is active in the clarity (but also in the deficiency performance of the whole process if it
is somehow misdeveloping) of the sensory capacities and in man's becoming 'kindness-endowed', that is, a Buddha.

When it has been said that in each of these 'control centers' one 'elemental force' is primary, this does not mean that the others are absent—they are merely functionally recessive in what may be termed an interlocking 'directorate'. There is another set of terms for these 'control centers' which complements and somewhat specifies related features. These are, in the same ascending order and in the same location, the 'control center of morphogenesis' (sprul-pa'i 'khor-lo), the 'control center of meaning' (chos-kyi 'khor-lo), the 'control center of intercommunication' (longs-spyod-kyi 'khor-lo), and the 'control center of pure pleasure' (bde-chen-gyi 'khor-lo). The last-named center points, on the one hand, to the optimum performance of the process as a whole and, on the other, inseparable from it, to the optimum nature this process has when 'lived' by the individual in the course of knowing his own norms and capabilities. In this context, what has been seen as the emergence of 'intelligence' with its 'memory storage' here reiterates the point that our immediate sense-impressions, as well as our thought-processes, drawn from perception and memory, tend to be complex wholes and as such are 'meanings'. This movement towards ever increasing complexity can be diagrammed as in Figure 1 (p. 18).

The directionality in the morphogenesis of living organisms, termed 'cephalization', implies that this process is intrinsically 'intelligent'. The intrinsic intelligence of this process suggests that there are 'eyes' which 'see' (regulate) the direction of developmental movement. This process, discussed above, is an interaction between 'elemental forces' ('byung-ba) whose behavior is governed by their specific properties (termed synthesis, gravitation, and so on) tending towards 'condensation' (snyigs-ma)—similar to the chemical processes of polymerization and macromolecular formation.

--- pervasive medium of 'space' (*nam-mkha';)

- the operationally dominant 'elemental force' (*byung-ba*) emergent within the 'pervasive medium of space' (*nam-mkha*') which is also the 'openness of Being'.
- the 'localization' of the emergent elemental forces.

--- leading to the development of organic matter and the body-mind phenomenon. In another process, the 'internal radiation energy' (*dvangs-ma*) of the elemental forces leads to 'spiritual' operations. It is as if this latter concurrent process were 'looking into' the former process in a deeper and farther manner.
When the body is first begotten, there originate, first of all, within the complex of the 'initial generator' which has started from synthesis, the 'eyes of the lamps' and the 'eyes of the elemental forces'. How, (taking its direction) from the 'eyes of the elemental forces', the body, (being the interaction of) four elemental forces, is formed has been explained above. (Taking its direction) from the 'eyes of the lamps', there originate as the foundation for the presence of pristine cognition, for Nirvāṇa which actually and truly is lucency, bioenergetic cognitiveness, the founding stratum (for existential meanings), two wide-open extremities within the buffalo-horn-like conductors inside the orbs of the pupils of the eyes—these are the 'lamps that penetrate what they have seen in the far distance and drawn to themselves' (rgyang-zhags chu’i sgron-ma).²³

It must not be assumed that, because of the reference to two sets of eyes, a dualistic principle is in any way involved; 'condensation' and 'radiation energy' are different perspectives of one and the same 'force'; in one case we 'see' dimly, in another we can 'see' clearly. Consequently, Śaṁśāra and Nirvāṇa are 'perspectives' issuing from and converging in the living individual, yet never owned by him.

While the 'control centers', with their intricate network of 'conductors' and the 'circuits' set up by them, represent a hierarchical order of horizontal layers, radiating in all directions by virtue of their radial symmetry, the bilateral symmetry vitalizing and even organizing these 'control centers' and their networks is indicated by a triad of 'conductors'. These conductors, as 'circuits', are responsible for the differentiation into right and left, male and female, body and mind, not so much as irreconcilable opposites but as complementary, interacting facets of an all-pervading flow of life, a 'standing-wave pattern' that can be seen from without or within or from still another deeper/higher level:

Thus, since the triad of ro-ma, rkyang-ma, and kun-dar-ma, the vitalizing axle in the 'conductors' of the four 'control centers'
in the live body, outwardly sets up the triad of body, speech, and (ego)mind; inwardly the triad of existentiality, communication, and spirituality; and mystically the triad of the founding strata of meaning which become embodied as concrete bearers of meaning, of world horizons, and of meaning in an ultimate sense; this triad stands there straight like pillars.

Although the illustration of this triad by 'pillars' seems to point to something approaching a solid entity or a rigid structure in which processes are somehow subordinate, actually it is the other way round: processes come first and structure is and remains more or less fluid. This is borne out by the definition of the three 'conductors' and by the fact that they are seen in the context of starting-point → path (process) → goal, where the 'starting-point' itself already presents a tension between the opposites of what is conventionally accepted to be the case and quite real operationally (kun-nldob), and what really is the case and primary (don-dam); the 'path' is the working out of this tension, not by choosing one or the other, but by reconciling them in a higher-order organization whose full quality as a value (goal) emerges out of the tension being worked out. There is, at every stage and at every moment, an interdependence of process and structure.

The fact that these 'conductors' are more of the nature of transactional flow-patterns that can be understood as 'cognitions, appreciations, discernments' (shes-rab) on the input side, and as 'experiments, adaptations, actions' (thabs) on the output side, held together by the common (open-ended) flow-pattern in which the differentiation into the two aspects (input-output) of the process no longer holds—although at any moment it may so emerge—is borne out by the definition of the 'conductors'. Speaking of definition, it must be borne in mind that 'conductors' are illustrative of the processes taking place, not demonstrative of static entities. Furthermore, as transactional flow-patterns they have no
particular point where they begin or end, and it is merely a
more or less arbitrary decision to start with the 'conductor'
tered ro-ma and then to continue with the rkyang-ma and
kun-dar-ma. We have to start somewhere, and since the dis­
cussion of these 'conductors' is tied in with the morpho­
genesis of the individual, it is obvious that there has taken
place an 'input' (the genetic code) before the 'output' (the
explication of the genetic code) began, and yet this same
output is being, and has been, checked and reaffirmed by the
'input'. To the extent that the output matches the informa­tion
input, it is felt and experienced as 'positive' while, when
it does not, it is 'negative'. This accounts for the apparently
contradictory definitions of ro-ma:

It is similar to salt because it seasons everything, and so it is
called ro ('flavor'), because on the basis of the optimally felt
value (bde-ba) of the bioenergetic flow-input (thig-le) it sets up
an uncommon (feeling) experience; and it is called ma ('bot­
tom'), because it starts from 'desire-attachment', (which is the
reason that) those who have desire-attachment can, on the
basis of this desire-attachment, grow up to Buddhahood. On
the other hand, ro ('corpse') means little activity, and since the
(feeling) experience, on the basis of the bioenergetic flow-
input's having gone wrong, is difficult to express in words, it
is called ma ('negative'). It is through this 'conductor' that the
bioenergetic input as reproductivity moves, and hence this
'conductor' is of the nature of 'action' (lhabs).

The intimate connection between 'action' and, as we may
say, the 'information input', expressed in the above illustra­tive
definition, highlights another significant aspect of this
transactional process. 'Action' is amplifying and exploratory
and can assume many forms of 'output', which either
matches the information input or not. In any case, it depends
on a steady flow of 'input' that must not diminish into 'dead
ends' or be 'slanted'. Consequently the rkyang-ma is de­
scribed as follows:
Since there are neither bends nor branches in it, it is rkyang, 'simple', 'solitary'. Being actually the source of both the bioenergetic input as it is experienced as input, and the bioenergetic input as it is accepted and felt as reproductivity, it brings to maturity and separates from one another the elemental forces as forces and as products. Since it is simple, it does not undergo changes. Since it is the foundation of everything, it is ma, 'mother'. It is through this facet that a person can grow up to Buddhahood effortlessly.26

Because of its definition as 'simple' and 'solitary' we may be misled into the assumption that there is little creativity in this flow-process. Actually, correlated to the control centers set up in the course of the process referred to as ro-ma, there are similar control centers that have to do with the deepening or intensification of the experience referred to by the 'lamps' that spread their light through the process termed rkyang-ma.27

Both the processes and structures of ro-ma and rkyang-ma (when seen as 'conductors') have their unity in the kun-dar-ma which is described in the following manner:

kun-dar-ma means 'to combine everything'. While kun ('everything') is so called because, on the basis of this (conductor as process), everything—the bioenergetic input as well as the optimally felt value of the conductors and the optimally felt value of 'motility'—comes into operation, it is because of its all-encompassing features in the most general way that it is called 'dar-ma ('vibrating').28

This all-encompassing feature is, like everything else, thoroughly dynamic as is evident from the additional information about the 'conductor':

(In the) kun-dar-ma the nature of all 'conductors' is summed up. It is 'vibrating' ('dar-ha) with the oscillating flux of motility, and it is 'motherly' (ma), because (thereby) it has become the foundation of both Sāṃsāra and Nirvāṇa.29
Because of this dynamic view that pervades the whole conception of man’s nature, his ‘samsaric’ and ‘nirvanic’ states are something like an alternating current phenomenon, so that the kun-'dar-ma may be seen as the ‘current’ with the ro-ma and rkyang-ma as the respective phases. The ro-ma is the ‘bioenergetic input’ at work as it is observed physiologically, and which, being merely a phase of the current, retains the nature of the ‘current’ which, by contrast, is psychic. The rkyang-ma is creative in being a high-frequency phenomenon, and also ‘intelligent’ as it sets up the organism’s complex order of ‘conductors’. This seems to be what Klong-chen rab-'byams-pa has in mind when he elaborates:

The wide-ranging openness that comes from the ‘central conductor’ without there being blood or lymph is ‘motility in action’ (rlung-gi las). Since through the right conductor lymph and blood and byang-sens move, this is ‘bioenergy in action’ (thig-le'i las), and since through the left conductor the radiation energy of the elemental forces as well as ye-shes proceed, this is the ‘conductors in action’ (risa rang-gi las).30

The significance of this passage lies in the fact that the triad of ‘conductors’, ‘motility’, and ‘bioenergetic input’ is presented here in still another perspective that makes any reductionist concretization impossible. No less significant is the contrast between byang-sens and ye-shes. The latter term can easily be rendered as the ‘wisdom of the body’ which, as the neuroanatomical ‘order’ of the organism, leads us to an understanding of what lies beyond that which we know how to analyze. The former is the trend towards recapturing the optimal value of being which, intellectually, we see and feel as the thrust for limpid clearness and consummate perspicacity, and which is, physiologically, the organism’s reproductive capacity triggering the morphogenesis of a ‘new’ organism. Both the density or condensation process and the high frequency or radiation process are a manifestation of a pervasive ‘current’.
However baffling, at first glance, this highly technical terminology may appear, because it combines what we have split into opposites, it is obvious that, in all these instances, interacting *dynamic* processes are at work, and that the boundary between ‘action’ and ‘cognition’, to mention only two of the most salient processes, is indeed fuzzy. Still something clear-cut and accurate can be said in the realm of experience which is brought to life again by what is, quite inadequately, called ‘meditation’.

We can speak of ‘action’ (*thabs*), as it proceeds ‘objectively’ and is described ‘factually’ as ‘pleasure’ (*kde-ba*), since it represents an optimally felt value in experience. It will be noticed that already here the gap between ‘fact’ (as isolated object) and ‘value’ (as subject’s response) is bridged. This bridging is itself a process and is related to the process indicated by the *ro-ma*.

We can speak further of a second and even larger process that occurs ‘subjectively’ through our cognitions and appreciations, which are not something static or concrete. There is, however, no knowing without acting as there is no acting without knowing. Knowing (appreciating, discriminating) is always unique, never some ‘thing’ or other; it is ‘open’ (*stong-pa*) and therefore it is not a ‘subject’ in the ordinary sense of the word. Through the uniqueness of cognition as a process the notion of ‘subject’ (I, self) is resolved. This is the work of the *rkyang-ma*.

Lastly, we can speak of a still larger process which may be called ‘totality process’, of which and in which our ‘cognitive processes’, as well as our ‘actional processes’, are occurrences which have the tendency to break up into separate areas. The totality process, *kun-'dar-ma*, is the immediacy out of which both the ‘subjective’ and the ‘objective’ are drawn and to which they point:

The *ro-ma* is pleasure, and having a specific activity it sets the ‘objective’ free in pure meaningfulness; the *rkyang-ma* is openness, and through pure appreciation sets the ‘subjective’
free in pure meaningfulness; and the kun-’dar-ma is the unity of pleasure and openness, and through this union reveals the pristine cognitiveness, that is free from the subjective and objective, to have no gaps.31

‘Action’ and ‘cognition’ are two processes superseded, as it were, and held together by a ‘totality process’ which holds the balance between the two other processes or, to state it more precisely, balances them out by being in the middle.

To speak of the kun-’dar-ma as balancing out the two processes designated as ‘action’ and ‘appreciation’ indirectly emphasizes the role this ‘conductor’ plays in the development of the bilateral symmetry, which points to an orientation towards an environment which is both external and internal and, hence, shaped in interaction. Nonetheless, in this orientation towards an environment as ‘life-world’, the cognitive phase of ‘appreciation’, which by its very nature is discerning and discriminative, takes precedence over ‘action’ which is experimental. There must be ‘information’ before something can be ‘worked out’. But even this latter phase is, in a certain sense, information too, insofar as it tells a person how it is going with him, whether the goal-directed and, incidentally, goal-inspired action is moving in the direction of the goal or not. But while the information input moves in a steady flow, the working out of this input has its ups and downs, and while this working out of the information flow that is steadily pouring in may be viewed as the ‘objective’ component, real enough in an operational sense (kun-rdzob), but secondary to the ‘subjective’ component it is this latter component that is ‘primary’ (don-dam), not as a static ‘ego’ or ‘self’ or ‘I’, but as a process of experiencing (perceiving, knowing, appreciating) without whose accuracy our ‘objective’ world would not even be operationally reliable. However, both the ‘objective’ and the ‘subjective’ operate in a larger field, the totality of our individuality, constantly interacting and continuously being ‘fed’ with meanings that remain strictly within and come out of this totality, in the
sense that this totality is with us all the time and yet nowhere, is without time and yet is every instant of time. As the problem under consideration is living man, not a lifeless abstraction, it is not by accident that this 'feeding' is said to be bioenergetic and, as sheer lucency, a high-frequency vibration whose inner content is 'meaning' and which is 'decoded' by pristine cognitions which are an equally bioenergetic process, and 'worked out' by a bioenergetic feedback. This will help us in understanding Klong-chen rab-'byams-pa's concise statement:

In the ro-ma there is what is real in a general and operational sense (kun-rdo-ri), the bioenergetic process triggering (related processes, rgyu'i thig-le) whose nature is 'action' (thabs) and whose felt value (bde-ba) is unsteady. In the rkyang-ma there is what is primary (don-dam), the bioenergetic process of pristine cognitiveness (ye-shes-kyi thig-le) whose nature is 'appreciative' (shes-rab) and whose felt value remains steady. In the kun-'dar-ma there is what it is actually about (rang-bzhin), the bioenergetic process of meaningfulness (chos-nyid-kyi thig-le) whose nature is spontaneously present sheer lucency, the non-duality of the totality-field (abyings) and its pristine cognitiveness (ye-shes).32

Diagrammatically, this is shown in Figure 2.

The complexity of all these 'conductors' as specific pathways along which the bioenergetic input is carried, together with the control centers at the various stages of the process, is also known as the 'energy body' (rdo-rje'i lus).33 On the one hand, it influences the working of an individual's mind and physical body which represent distinct energy patterns, and, on the other, it links each individual with the whole of Being. This is indicated by reference to another 'conductor'-pattern34 which is no less complex than the triadic one discussed here, because of the significance that attention to this 'energy body' has for the optimal life performance of and by an individual.
FIGURE 2

ACTUALITY (rang-bzhin)

Dullness (gti-mug)

'CENTRAL' FLOW-PATTERN
(kun-'dar-ma)

APPRECIATION (shes-rab) ACTION (thabs)

Desire-Attachment ('dod-chags) Irritation-Aversion (che-sdang)

'LEFT' FLOW-PATTERN ←→ 'RIGHT' FLOW-PATTERN
(rkyang-ma) (ro-ma)

(1) The 'primary' process (don-dam) is ACTUALITY, APPRECIATION, and ACTION.
(2) The 'operationally valid' process (kun-rdzob) is Dullness, Desire-Attachment, and Irritation-Aversion.
(3) '→ → →' indicates the change which takes place in the transition from 'primary' to 'operationally-valid' processes.
(4) '→ → →' indicate the dynamic 'flow' between the 'CENTRAL', 'LEFT', and 'RIGHT' FLOW-PATTERNS or 'conductors' (rtsa).

The primary process is immediately present in experience and is the 'starting point' of all interpretations belonging to the operationally valid process. Both processes are active 'within' and 'through' the conductors or flow-patterns.
Related to this problem of the 'energy body' being an intermediary is the question about its origin. Surprisingly the answer is already contained in the definition of the 'energy body' as being thoroughly dynamic with nothing static whatsoever about it, and in the distinction between that which is real enough in an operational sense (kun-rdzob), as this is what is commonly observable and 'objective' and in the foreground, and that which is primary (don-dam) but less easily accessible and hence 'subjective' and in the background—as far as the concrete living individual is concerned, who, after all, through his 'subjective' component remains linked with the 'totality field' (rang-bzhin) that is his 'existence'. But this totality field is itself linked to an even larger field so that the one commonly dealt with in its triadic pattern of the 'conductors' is operationally real, while the larger field having high-frequency radiation by virtue of its 'sheer lucency' (bstd-gsal), remains and acts as being primary.

The consequence of this idea is that the 'energy body' does not start abruptly at the moment of some initial time $t_0$ but that this moment marks the separation of the total interaction. This separation involves a drop in the frequency of radiation and leads to one-half of the totality having less energy which, figuratively speaking, is said to belong to 'our side'. In rDzogs-chen thinking this drop is known as ma-rig-pa, 'loss in rig-pa', 'loss in pure awareness'. The term 'pure awareness' (rig-pa) indicates the 'intelligent' nature of the universe of which man is, so to say, a low-frequency manifestation. In other words, 'cognitiveness' in all its primacy (ye-shes) has become 'emotiveness' (nyon-mongs) with 'dullness' (gti-mug) predominating.

The most important and stimulating aspect of these ideas is that what happens on 'our' side has a relationship to what happens on the 'other' side. That which happens on the other side, in approaching the moment $t_0$ seems to be able to maintain its coherence as it passes through $t_0$. Yet as it passes
into 'our' side it becomes a kind of 'blurred primacy'—the 'subjective' component in the 'energy body' reaching into our concrete world of subject-object distinctions. The state of affairs on 'our side' is thus subject to control by, and owes much of what goes on in ourselves to, what happens on the 'other side'. Once it is on 'our side', the operating forces bring about a distortion of what has come. The interesting point to note here is that much of our present situation is due to the situation on the far side of that boundary which has hitherto been thought to represent the origin of our being. Thus Klong-chen rab-byams-pa declares,

Although the 'energy body' is shown as a triad of conductors, motility, and bioenergetic input, actually it is not found to be different from the facticity of the unitary pristine cognitiveness. As is stated in the Rig-pa rang-shar chen-po'i rgyud:

Even the conductors, motility, and bioenergetic input
Are not such as to have passed beyond the reach and
range of pristine cognitiveness.

Therefore, even at the time of impurity, they have not passed beyond the triad of facticity, actuality, and responsiveness, as is stated in the Seng-ge rtsal-rdzogs chen-po'i rgyud:

In all the sentient beings of all the three spheres,
There resides the triple hierarchy of the essential
cognitiveness.\textsuperscript{35}

He gives a more elaborate account of the dynamic process in its ramifications, even as it takes place on 'our side', in the following words:

In this area which is real enough in an operational sense (kun-rdzob), the three conductors derive from a loss in 'pure awareness' and form the basis for 'desire-attachment' on the left side, for 'irritation-aversion' on the right side, and for 'dullness' in the center; the shel-sbug-can\textsuperscript{36} does not form a basis for anything that is 'impure'. In the time that is primary (to this development) they are, generally speaking, estab-
lished by the dynamics of pristine cognitiveness, in particular, as 'action' (thabs) on the right side, 'appreciation' (shes-rab) on the left side, and as their unity in the center.37

Taking these two passages together we may illuminate them by drawing from recent findings in astronomy. Let us assume that the moment $t_0$ represents the moment that separates positive interactions from negative ones, and let us call the negative ones 'the other side' since the interactions taking place there are not directly observable. Let us further assume that what happens on the 'other side' is similar to what happens on 'our side'. When what happens on the 'other side'—the interaction between facticity, actuality, and responsiveness—draws nearer the moment $t_0$ and passes through it, it retains its identity of the 'other side' but its radiation is 'blurred' into the interaction of 'action', 'appreciation', and their 'unity'. It is this blurred interaction which is detectable and which, as such, is similar to what astronomers call 'microwave background radiation'. When this movement reaches the moment $t_1$, (in addition to becoming blurred) it is deflected by what I shall call the 'psychological red-shift', which accounts for the fact that 'pristine cognitiveness', in its passage through $t_0$ and proceeding to $t_1$, becomes 'emotiveness'. That is to say, just as with each passing moment the successive photons emitted from receding galaxies have farther to travel to reach the earth so that their rate of arrival is slower than it would have been if the galaxy had been stationary, and in the same way as the Doppler effect accounts for the shift of photons to lower frequencies so that they have less energy, so also the 'light values of the various kinds of pristine cognitiveness' deriving from 'sheer-lucency' in moving away from $t_0$ to $t_1$, $t_2$, ... $t_n$ take longer to reach us (who are likewise not stationary) so that their brightness is dimmed and the shift to lower frequencies gives the 'emotions' their specific colors.

The following diagram attempts to illustrate this interaction in highly schematized form:
(1) During 'A', which characterizes the dynamics of the 'other side' up to the initial moment $t_0$, 'facticity' (ngo-bo), an utter openness, is present in and as 'actuality' (rang-bzhin), a pure radiance, which solicits and receives 'responsiveness' (thugs-rje) or resonance, a pristine cognitiveness. '---' indicates the interconnectedness of these dynamics which cannot be further specified.

(2) 'A(a)' represents what takes place between $t_0$ and $t_1$. At $t_0$ it seems that the bare presence of the dynamic patterning in 'A' has developed to such a degree that 'actuality' crosses over, thereby initiating a development which we can call 'this side'. After $t_0$ 'actuality' is present as a sustaining and holding together of the dialectical movement between 'appreciation' (shes-rab) as information input, and 'action' (thabs) as the developmental and morphogenetic unfolding of this input.

(3) 'B' represents what takes place after moment $t_1$ and may be characterized as a kind of 'red shift' in which 'actuality' operates as 'dullness-lusterlessness' (gti-mug), 'appreciation' operates as 'desire-attachment' ('dod-chags), and 'action' operates as 'irritation-aversion' (zhe-sdang). In psychological terms the situation after $t_1$ is one in which we are alienated from ourselves.

'---' indicates that a triadic interrelatedness operates in all situations after $t_0$ (that is, in both A(a), and B).

A and A(a) are 'primary' processes (don-dam); B is the 'operationally valid' process (kun-rdzob).
When Klong-chen rab-'byams-pa goes on to say that

At the period of the path (these three conductors) form the basis for pleasure (bde-ba) on the left side, for radiance (gsal-ba) on the right side, and for non-dividedness (mi-riog-pa) in the center,\(^{38}\)

he points to the phenomenon which indicates in which direction the process is going, and which helps a person to see that he is moving in the right direction. It is these phenomena, therefore, that are specifically discussed in this part of the Trilogy. ‘Giving in’ to the emotions is a waste and, as we would say, ‘entropic’ in character; ‘tuning in’ to the bioenergetic process is to activate man’s potential, or, as Klong-chen rab-'byams-pa says,

At the goal (these conductors) form the basis for the founding stratum of meaning (chos-sku) in the center, for the founding strata of a world-horizon (longs-sku) and of bearers of apprehendable meaning (sprul-sku) on the right side, and the basis for absolute pleasure, sheer lucency, as infinite as the sky, on the left side.\(^{39}\)

The interrelation of these phenomena may be seen diagrammatically in Figure 4.

It seems as if the prevailing and, on the whole, symmetrical arrangement and ordering of the processes taking place in and characterizing the growth of an individual, has been given up when the level of the ‘goal’ is reached. Here, from among the three founding strata—that of meaning (chos-sku), of engagement in a world-horizon saturated with meaning (longs-sku), and of embodiments of meaning (sprul-sku)—the founding stratum of meaning, as should be expected, is in the center. On the level of the path, this represented the non-dividedness of radiance and pleasure as indicators that the process or ‘path’ went as it was meant to proceed, and which, in the ‘primary’ or ‘subjective’ level (as contrasted with the operationally real and ‘objective’ level with the emotional vagaries that characterize the body-speech-mind
configuration of the person), represented the unity of ‘action’ and ‘appreciation’ (remaining dialectically related while the emotions are in open conflict).

The two other founding strata are said to be on the right side. Both of them are such that the one follows out of the other, and both of them are ‘primary’ in the sense that as existential experiences they lend themselves to ‘secondary’ concretizations and descriptions as lifeless abstractions which are the domain of the ‘objective’ contents of mind. As
to their 'primacy', they are truly on the side of 'action' inasmuch as they themselves are the enactment of the 'central meaning'. But on the left side there is no founding stratum, rather there is 'absolute pleasure, sheer lucency' which operates through, while remaining beyond, 'appreciation' which is already the creation of the creativity (rtsal) that is pristine cognitiveness (ye-shes). This, in turn, is sheer lucency and pure pleasure which we may experience as that which makes us become a 'founding stratum' (sku). A 'founding stratum' is a knowingly-felt 'presence', and as such belongs to the thematic-reflective aspect of experience, rather than to that which makes this aspect possible. As Klong-chen rab-byams-pa remarks:

While the ordinary spiritual pursuit claims the three founding strata to be the goal, the rDzogs-chen teaching claims them to be the 'presence of the path' (lam-gyi snang-ba). Even the founding stratum of meaning (chos-sku) is but a 'presence of the path'. As long as there is 'meaning' (chos), there is the intellect (blo) and this involves the path. As long as there is a 'founding stratum' (sku), there is the living body (lus) (as founding stratum for the intellect), and this, too, is a presence of the path. It is not the ultimate.50

Thus, what in the previously quoted passage seemed to be an unequal distribution of the three founding strata in the prevalent triadic pattern (of pleasure, non-dividedness, and radiance) has turned out to be an accurate observation. A goal that is a dead end because it is a referent of the intellect is not a goal worth the name for 'cognitive systems' as represented by a living person.

The 'path' as a continuing process involving the whole person, makes itself known and felt and apprehendable in the phenomena of pleasure, radiance, and non-dividedness which as phenomena and indices attract the person's attention and, for this reason, lend themselves to become misidentified as 'what meditation is all about'. Non-dividedness (mi-rtog-pa) is not a mere absence of divisive concepts and of
thought in general, but, figuratively speaking, is the situation of having risen above the dichotomies set up and multiplied by divisive concepts, and hence makes us know more. It is integrative of the splits within the individual. Since an individual is not in a vacuum, non-dividedness is also integrative of the splits between one individual and another, and between individuals and their environment. In being integrative it is central and centering, and therefore it is related to the central ‘conductor’ in the ‘energy body’. Because of the attention it attracts it may easily be misidentified through interference by the intellect and, speaking in a very broad way, be turned into ‘dullness’ which, as an induced state of proverbial blankness of the mind, leaves the person who pursues such a course worse off than he was before.

Pleasure (bde-ba) is not merely a bodily sensation, but is more an indication of a person’s mood. It would be rather difficult to be pleasurably excited and to enjoy some situation while one is divided against oneself. Pleasure therefore is felt and grows in intensity as the dissociative tendencies are overcome. Because of its informative character, telling us how things are going with us, it is on the left in the ‘energy body’, as this side is related to ‘appreciation’. Pleasure is strongly ‘felt’ in the body as the common ground upon which sex and love meet. However, to separate sex and love and then to go on to define the one as ‘biological’ and ‘operational’, and the other as ‘psychological’ and ‘appreciative’, shows a dissociative tendency which leads to a misidentification of pleasure as sex-and-sex-only because of the undeniable presence of the body. A preoccupation with the body, usually coupled with fear and anxiety about it, reveals a peculiar naiveté, and, in Klong-chen rab-byams-pa’s words, is characteristic of a person of low intelligence. On the other hand, to reject the ‘body’ and to indulge in ‘sentiments of love’ is no less dissociative, although it admits of something other than just the physical body. Still, these sentiments borrow their imagery from the physical. Like
Introduction

non-dividedness, pleasure is irreducible; it informs and shapes the personality and for this reason cannot be commanded.

Correlated with pleasure is radiance (gsal-ba), which is an aspect of motility and excitation. While pleasure is appreciative, radiance is operational in the sense that it is 'working out' the information that is steadily pouring in. Therefore radiance is associated with the right in the 'energy body', as it is this side that acts and works out. This active and operational quality is noticeable in any living individual. A person is 'glowing' when he is at his best. But to be at one's best means not to be dissociated and divided, and by implication, not to be depressed or unhappy. The moment dissociative tendencies reassert themselves, as when 'appreciation' is turned into a cold judgment of 'fact' by the intellect, not only is pleasure reduced, but radiance is quickly lost. The eyes no longer 'sparkle', the complexion of the skin is pasty, and there is a general lack of aliveness. Radiance is a 'steady' quality and must not be confused or misidentified with a sudden glow that may occur in the rush of an emotion. Such misidentification would merely intensify an already dissociated state.

Precisely because it is through pleasure, radiance, and non-dividedness that we can learn about ourselves, they can never be considered as and must never be made an end in themselves. To do so would effectively block the very possibility of ever learning more about ourselves. It is for this reason that their positive (negentropic) as well as negative (entropic) features, which as an in-built tension energize the individual to pursue his path through life, are discussed at great length with reference to the individual's 'intelligence', which is not something uniform but varies from individual to individual. Pleasure, radiance, and non-dividedness, each in its own way, and even more so jointly, aid in the development of a particular capacity for understanding ourselves and of a particular attitude that makes such understanding more feasible. They are thus that aspect of life which enables
us to make the 'big jump' to where we become the stream of life itself. To be this stream itself is, in rDzogs-chen thought and practice, bsam-gtan which we have seen indicates only mediatelty what is meant by the English word 'meditation'. Everything else is the exercise of 'creative imagination', 'contemplative attention' (sgom-pa), which could be called 'meditation' in a very loose way.

'Creative imagination' is a way of thinking of and attending to something present by thinking of it, or even perceiving it, in terms of something absent. The thoughts and feelings that are so aroused become part of the experience itself and transform it without diverting it from what has been initially present. Being of the nature of thinking it is related to both concentration and conception. 'Concentration' involves something upon which the mind is focussed or centered to the exclusion of everything else. It has, so to speak, something concrete to deal with (rten-can). 'Imagination' does not have something concrete (rten-med), yet it is the capacity by which we become aware of something present (snang-bcas), of something which, lacking 'concreteness', belongs to the inner life. 'Conception' deals with what may never show up (snang-med). I can imagine an 'energy body' as I can concentrate on a painting, but I can neither imagine nor concentrate on emptiness although I can conceive of it. Thus the common feature of concentration, imagination, and conception is that they are primarily referential, but insofar as they are processes they may approach the non-referential phase, in which dividedness into subject-object seems to have been overcome. Actually, the division has merely been suspended temporarily, and the 'big jump' from the subjective realm to the totality realm has not yet been made.

'Creative imagination' (sgom-pa) may give us a glimpse of what it might mean to be the stream of life maintaining its continuous forward thrust, but it is not this stream. And yet it is this stream that matters. Making this 'big jump' by which we become the stream itself, no longer remaining its onlookers, is bsam-gtan, 'becoming the stream in being the
stream’. Thus the distinction between *sgom-pa* (creative imagination, contemplative attention, ‘meditation’, abstract conceiving) and *bsam-gtan* (the experience of totality in and through the totality of Being) is of paramount importance. As Klong-chen rab-'byams-pa explains:41

Many gradations in the objective reference as a means to guide the average person within the ordinary spiritual pursuits, and here in the (rDzogs-chen way) the less fortunate ones, have been discussed. But they all can be subsumed under pursuing an objective reference which either has something concrete about it (*rien-can*) or not (*rien-med*). That which has something concrete about it (*rien-can*) involves a steady concentration of the mind on anything that is an object of the external world such as a colored patch, a sound, a fragrance, a tactile pressure and so on; it also involves concentrating the mind on the figure of a god, (his or her) symbols, a small piece of wood or a pebble. That which has nothing concrete about itself (*rien-med*) is an object of subjective (imaginative) thinking. Insofar as it deals with what is ‘felt’ as a presence (*snang-heas*), it involves the claim of not giving in to conceptualization when the mind has been concentrated on each or any objective reference referred to as ‘conductor’, ‘motility’, or ‘bioenergetic input’, and it also involves such objective references as syllabic sound symbols, globules of light, control centers within the conductors, the fire of inner heat, and so on. It is concentrating the mind on the gradation of the imaginative thinking process. If it is a matter of nothing showing up (*snang-med*), it involves sitting cross-legged and projecting the mind into a state where no concepts enter and holding it there absolutely motionless. This state of utter blankness is an objective reference that is not conceptually objectifiable. In general terms, the statement that an objective reference is either conceptually objectifiable or not belongs to this feature. In brief, any claim that something is referential is a product of imagination. It is a steadying of the mind, an expectation of a result through its steadiness, and its function is the suspension of the subject-object dichotomy. In the *sGra thal-'gyur chen-po'i rgyud*42 it has been stated:
Creative imagination means to have the mind in a steady state.
And to cut off any outward or inward movement.
It is the suspension of the subject-object dichotomy.

And,
Furthermore, (attending to) the conductors, motility, bioenergetic input,
Vital spots in the body, and emptiness
Are claimed to be creative imagination.\(^4\)

Since all this, precisely because of its claim to suspend the subject-object dichotomy, lets the objective reference become an object and the intellect a subject, it is not the being tuned-in into the profoundness of one's being; rather, it is merely a means to bring a person to his profound nature.

The specificity of \textit{bsam-gtan} in rdZogs-chen thought and practice is that in the same way as there is heat in its own right as long as there is fire, or moisture throughout in water, so also there is \textit{bsam-gtan} throughout with respect to 'pure awareness' (rig-pa). As long as 'pure awareness' is experientially encountered, one stays in what is \textit{bsam-gtan} steeped throughout in itself. Hence, the experience of pleasure, radiance, and non-dividedness comes by itself and naturally rather than by being contrived. Similarly the experience of the intermediate and reorganizatory state comes as such a state settled throughout in itself as 'pure awareness'. As long as one deals with 'mind' (sems), the experience that imagines the mind to be in a steady state is set up with effort and is going to break down, and this is as it is (wherever the mind is involved). As long as one deals with pristine cognitiveness (which is) 'pure awareness' (in operation), one stays in the stream that is \textit{bsam-gtan}, steeped throughout in itself, and hence the capabilities that have come into operation naturally remain such that throughout time they are inseparable.

And so it is in \textit{bsam-gtan}, the experience of totality in and through the totality of Being, that we may find comfort and ease, while it is the preoccupation with \textit{sems}, the mind as the noetic-noematic complex with its built-in limitations and disruptive tendencies, that has us worried.
To an alarming degree modern man has lost his sense of place, this delicate awareness of a mute and deep affinity with the environment. In the Western world this loss is due to a one-sided, ideologically misdirected approach to the problem of man and the universe, and in the East this calamitous approach is readily followed and hailed as progress. This disastrous disorientation has started from the assumption of a permanent separation between subject and object, the observer and the observed. Following its own logic, it has taken an impersonal and allegedly value-free stance which nevertheless is tainted by modern (Western) man's inheritance of the medieval delight in the corruption of the flesh. This latter, being of the same stuff as 'nature' (and in contrast with 'spirit', which is 'abstract' and pure), is seen as dirty, alien, hostile, and evil, and hence in need of being conquered, subjugated, and disinfected. As a consequence, nature or man's environment lies outside the range of ethical responsibility for human action upon it.

Although modern man may deceive himself into believing that he has outgrown this medieval superstition and that
all he does now is merely to assess the world ‘objectively’ and impersonally, his supposedly ‘rational’ approach remains essentially wishful and artificial. It is ‘wishful’ in the sense that the underlying assumption, that all that has been excluded from the live world is of no relevance for the abstract model of the world measured in quantitative terms, will not be noticed and exposed for what it is—a mere assumption. It is ‘artificial’ in the sense that the formalization of arbitrarily selected aspects of reality into supposedly ‘objective’ truth remains a ‘subjective’ construction if not a painful distortion. However, regardless of whether or not we extol ‘objectivity’ and denounce ‘subjectivity’—and we should not pretend that we do this on purely ‘rational’ grounds—we merely exhibit a state of ‘having-gone-astray’ (khrul-pa).

This fact of ‘having-gone-astray’, as well as our propensity for continually ‘going astray’ into the debris of dead and deadening postulates, are not inescapable patterns of human existence (envisaged either as a closed equilibrium system with monotonously increasing entropy in the terms of physics, or as a state of fallenness from which man is unable to rise by himself, in the terms of traditional Western religion). The propensity for going astray, rather, implies the possibility of ‘finding one’s way back to’, and again being ‘in tune with’, the very source of our being, which can never be a static absolute.

Such a possibility, therefore, does not maintain a separation between man and the universe, nor does it reinforce our dividedness against ourselves, which is the outcome of our ‘having-gone-astray’. Instead, it helps to heal self-inflicted wounds by deeply involving us in the process of rediscovering the identity of the forces operating in the observer and the observed world. In this process we encounter and respond to a wealth of qualities which, in turn, are the outcome of the interaction between the ‘material’ without—the forces that, as forces, solicit a response—and the ‘psychic’ within—the forces that, as forces in responding to
these solicitations, bestow fresh meaning upon the interaction taking place. This interaction brings into the foreground feelings through which we communicate with life: in the interpersonal domain through love and compassion (and also hatred), and in our natural environment by resonance (and also dissonance), by being ‘in tune’ (and ‘out of tune’) with biorhythms as exemplified by the seasons.

Such communication takes on the character of a personal relationship between man and his environment. It becomes ‘anthropomorphic’ in the sense that nature not only speaks to man, be it in a friendly or hostile, gentle or stern, reassuring or threatening way, but is also spoken to and ‘acted upon’ in the same manner. Thus feelings of calmness, expansion, powerfulness, severity and oppressiveness, which some places may inspire, are the direct experience of the working of the self-realizing and self-organizing creative unity of man and world, the ‘Buddha overall intentionality’ within and through each of us, a totality that is inclusive in not having a subject-world dichotomy and is a timeless now-and-here.

This experience comes to us in images of ‘gods’ or ‘goddesses’, of malignant demons or enchanting nymphs, and through the appreciation of these images we gain knowledge about the features of, for example, a place or an object. Images are kinds of thought, exhibiting the same intentionality as thought and being known as immediately as thoughts. In effect, then, this knowledge about certain features has two dimensions: one of thought, and one of experience. As thought it may be expressed in a propositional construction; as experience it may be paraphrased as being the sensory ‘embodiment’ of what otherwise is merely a ‘thought’. We may ‘think of’ a place as having a languorous atmosphere and express it in the appropriate proposition, but we may also ‘experience’ this languorousness as an enchantress—alluring, charming and fascinating—the sensuous and sensual ‘embodiment’ of our thoughts.
It is through experience, which may be triggered by any encounter with reality, or in the narrower sense, by the place in which man lives as part of reality and with which he interacts, that he feels the dynamic forces of the universe acting through him. In exercising these forces creatively he defines himself as well as his place in and relationship to the world. This creative exercise, which does not occur in a vacuum nor even at random, is technically known as the 'Developing Stage' and the 'Fulfillment Stage', in the exercise of which both deterministic and finalistic principles are at work.

In order to define oneself and one's place in the world, to reach one's goal (regardless of whether we conceive of it in static or dynamic terms), deterministic (intentional) processes have to be set up, such as those covered by the term 'Developing Stage'. Nevertheless these practices are guided from the direction of the goal, not in the sense of involving a final cause, but of being concerned with tendencies towards a terminus whose constancy or steady state is one of a continuous flow of component material, such as is referred to by the term 'Fulfillment Stage'. The former, by virtue of being a creative process, involves anticipatory action which aims towards ever renewed spiritual life by devising feasible paradigms. This becomes evident from what Klong-chen rab-'byams-pa has to say about the Developing Stage:

Thus the external world is to be a (Buddha) realm and the sentient beings are to be deities;
One's own body is to be a beautiful palace, one's speech a first utterance;
And one's mind the radiance of divinity—thereby preoccupation with the ordinary ceases.
Still, the stains of the obscurations that accompany the continuum (of experience and Being) have not been burnt away.

The Developing Stage is a step in the direction of greater psychic receptivity manifest as qualitative patterns. It is an 'opening up' in establishing relationships with both people
and the non-personal world. But while the Developing Stage merely indicates man's relating to a world or reality in whose shaping he is actively participating, it is the appreciativeness of the Fulfillment Stage which constitutes the determinative principle and which gives increased meaning to our actions and our world without rigidifying either. It is only a manner of speaking when we say that the Fulfillment Stage 'follows' the Developing Stage:

Thereafter comes the cultivation of the Fulfillment Stage,
Mind-as-such as unobjectifiable meaningfulness and
Mind-as-such as sheer lucency,
This is the intention of the Tantras dealing with
ultimate certainty.³

As Klong-chen rab-'byams-pa explains, in the Developing Stage we are still 'on the surface' and the 'surface' still obscures the 'depth' of our Being; in the Fulfillment Stage we are not only 'in the midst of reality', we have penetrated to the 'depth', to 'reality' itself:⁴

Having had on the previous stage our mind blaze forth as a god, here Mind-as-such is cultivated as Fulfillment Stage, which is to make the founding stratum of apprehendable meaning and the founding stratum of meaningfulness,⁵ aesthetic presence and the open dimension of Being, the way. Ignorant persons, claiming the rambling of the mind and the concrete forms of content it assumes to be the Fulfillment Stage, are mistaken because they make the aesthetic presence and the concrete forms of content it takes, their operational field. Fulfillment means to make the open dimension of Being and its unconcretizable meaningfulness the operational field.

While there is interplay of action and appreciation, both being experiences of a self-regulating and self-transcending process, there is also, seen from another perspective, an interplay of man and his environment—whether this be of the 'natural' kind or of his own making—which is ultimately designed to facilitate his 'tuning in' to that wider reality which he intuitively knows and feels to be his real home.
Praise to Śrī Samanābhadra

Homage from within the ground, complete, neither stepping out of itself into a different realm nor changing into something other than itself,
To this very core of limpid clearness and consummate perspicacity, sheer lucency, Mind-as-such,
Whose actuality since its beginningness beginning,
like the clear sky, has been a pure translucent continuity,
And whose supreme meaningfulness has remained unperturbed and inaccessible to propositions.

So that there may arise an understanding of the working of pristine cognitions which are the outcome of that intrinsic cognitive capacity within each of us,
Which is most wondrous Buddha intentionality,
Listen to my explanation of how I have experienced it
Through the elixir extracted from the essence of the Tantras, the discourses (by the Buddhas), and the instructions (by competent teachers).

In places pleasing to the mind in the four seasons, Such as mountain peaks, dense forests, and islets, A holistic feeling of calmness, well-focussed (on itself) and unperturbed, Sheer lucency divested of all propositions about it will have to be cultivated.
And it will come through three factors concurring in natural purity:
Place, individual, and the content to be experienced.
First, the place must be conducive to spiritual practices in the four seasons
By being secluded and enjoyable:
In summer, you should contemplate inside cool houses in cool places
Such as huts made of reeds or bamboo or fragrant grass
Near glaciers or mountain peaks.
In autumn, you should seasonally adjust your food, clothes, and activities
In houses and places where a balance is struck between cool and warm,
Such as dense forests and mountain slopes and rock-hewn dens.
In winter, you should adjust your food, clothing, bedding, and so on
In warm regions and low-lying places
Such as dense forests, mountain caves, and earthen houses.
In spring, it is most important that food, clothes, and activities are in harmony,
Whether you live in the mountains, forests, islets, or
In houses that are suitable in providing a balance between cool and warm.

Since the without and the within are the same in their hierarchical interaction,
You must resort to secluded and enjoyable places that are pleasing to the mind:
Since on mountain peaks the cognitive capacity clears and expands,
They are the places to dispel depression, and there the Developing Stage flourishes.
Since on glaciers holistic feeling becomes irradiating and lucent, and intrinsic awareness ever more clear,
They are the places to cultivate wider perspective, and there obstacles are few.
Since in dense forests, the cognitive capacity becomes settled in itself and stabilization of the mind takes place,

They are the places to cultivate inner calm,

where a feeling of pleasure is very deep.

Near rocks, the awareness of impermanence and disgust with (what will not last) grows;

Clarity and sublimity grow more intense, and inner calm and wider perspective form a unity.

River banks make you attend to the essentials;

They quicken and renew the necessity to escape from the present situation.

Cremation grounds are a great blessing, and rewards (for spiritual efforts) come quickly.

They are said to be of highest value for realizing either the Developing Stage or the Fulfillment Stage.

Villages, markets, empty houses, solitary trees, and so on

Are places frequented by humans, non-humans, and goblins;

They are upsetting to the beginner and create obstacles, but they are friends to those who are already firm and stable and hence are said to be of greatest value.

Shrine rooms, funeral monuments, and places with miasmic emanations?

Make your mind feel giddy and thoughts of hatred grow.

In places such as caverns with a languorous atmosphere

Lust is born and feelings of depression and elation grow in excess.

Solitary trees having an aura of positive or negative afflatus, as well as

Rocks and mountain spurs with their threatening dangers,

Are said to make your mind feel giddy, to create
unfavorable conditions, and to set up many obstacles.
Where outcasts, vicious snakes, and the deities of the soil are living—
Lake shores, alpine meadows, dense forests,
Bedecked with lovely flowers and adorned with fruit-bearing trees—
May, at first, be pleasing, but later on will create many obstacles.

In brief, there are places and houses which at first are quite pleasing,
But the more familiar you become with them, they turn out to be unpleasant with few rewards (for your spiritual efforts);
There are others that at first are frightening and vexatious, but become very pleasing the more familiar you become with them;
They offer supreme blessings; rewards (for your spiritual efforts) are quickly repeated, and there are no obstacles.
Apart from these two kinds, all others are neutral and do not offer any benefit or harm.

Since, depending on the place in which you reside, your mind undergoes a change,
And there is either growth or decline in your efforts in what is healthy and wholesome,
It has been said that it is of utmost importance to examine the place or the locality.

To sum up, there are also four (kinds of) places corresponding (in mood) to the four kinds of actions:
Places inspiring 'inner calm' automatically keep the mind steady;
Places conveying the feeling of ‘expansion’ have the mind rejoicing and resplendent in grandeur; Places implying ‘powerfulness’ have the mind captured and attached; Places conveying the feeling of ‘severity’ make the mind dizzy and induce dread and terror. In their subdivision these places are countless and beyond measure.

Here, however, since places inspiring inner calm to aid holistic feelings are of primary importance, The other places will not be discussed for fear of becoming too prolix.

In places inspiring inner calm, the meditation hut Must be set up in solitude so as to insure that the mind is kept steady; The best type is one open at the sides and receiving plenty of light from above.

For meditation during the night, an absolutely dark (and soundproof) room with an equally dark circumambulatory passage around it, is required, The room itself being like the navel within the circumjacent structure situated on higher levels. In this room you should lie down in the posture of the Buddha passing into Nirvāṇa, the pillow for the head turned northward. During daytime the place for meditation should have much light: Where the open sky can shine in and much light will come through the opening in the ceiling, From glaciers, waterfalls, forests, and landscapes. With the mind becoming radiant and pellucid, a balance between cool and warm must be struck.

‘When the time has come to (attend to) inner calm, a solitary hut surrounded by a fence
Is the best place where stability of mind can grow naturally.

When the time has come to (attend to) wider perspective, much light and brightness from above is important.

It is important to have your mind continuously rejoicing and attuned to the seasons.

It is important to know these specifications:
Low-lying and shadowy areas such as forests and ravines are places for (developing) inner calm;
High localities such as snow-mountains and the like are places for (gaining) wider perspective.

In brief, such localities as well as solitary huts—Where the mind is kept to the essentials, escape from and disgust with (the present situation)—Are the places where you should profitably apply yourself to what is healthy and wholesome since here holistic feelings grow.
Frequent them because they resemble the abode of limpid clearness and consummate perspicacity, the very quintessence (of life).

But where, by living there, the healthy and wholesome diminishes and emotional disturbances increase, And where worries about this life with all its excitements and distractions become overwhelming, These are the places of spiritual death, of evil deeds. Hence, the wise will shun them.

Since these places have been explained by Padmasambhava, Those desiring liberation should know them.
CHAPTER TWO

The Individual

Man is not ‘thrown into an alien world’ but interacts with it in intricate ways which display a tendency towards order within us and around us. But there are also ‘disordering’ tendencies which, because they are or, at least, seem to be very powerful, have attracted wider attention. A more dispassionate view would see them as pointers to the overriding importance of the ‘ordering’ tendencies which are so conspicuous in living organisms. As a living organism, man, in particular, is an open, self-regulating system in non-equilibrium, not an immutable essence or closed system. Within his ‘world’ he struggles with himself in order to make himself ‘whole’. But wholeness must not be misunderstood as implying that he has reached a terminus and now must stay put. This would reduce living man to a statistical and quantitative entity among other non-interacting closed systems.

Wholeness is qualitative and of paramount significance for man, that is, it constitutes a value worth striving for. Therefore, living man activates, on the reflective level of
consciousness, error-correcting processes which are aimed at restoring him to his value from which he has moved away through misinterpretation of what is his goal. It is on this reflective level that a basically sound goal-directedness, as well as goal-informed striving, becomes distorted through misidentification. Inasmuch as value is intrinsic to the life of man, it functions effectively in it, as becomes evident from man’s striving after goals (genuine or misconstrued ones). However, the full quality of value emerges only from a tension between opposites which must be resolved.

Living man is thus a complex dynamic pattern, not made up of isolated particular entities but of coordinated subpatterns which present an interdeterminate network of mutually qualifying causes and effects. As such a pattern or ‘system’, man appears as a process of adaptive self-organization and self-stabilization, by which the environment with which there is constant interaction is fitted to intrinsic constraints whereby the process organizes itself to a progressively more complex and ‘efficient’ pattern. This is to say, the adaptive self-organization is not ‘merely’ adaptive (utilitarian), but ‘overflowing’ (‘creative’ in the sense that man sees himself and his world with a fresh, life-enhancing vision), and the accompanying self-stabilization tends to maintain the resistance to perturbing forces in the environment.

Focussing on some of these qualitative processes and seeing them in the context of environment and growth, Klong-chen rab-'byams-pa illustrates the dynamic ‘nature’ of man as follows:

Since confidence, perseverance, and the desire to escape are similar to a field whose nature is meaning, they are indispensable. Since disgust with Samsāra is the gate to meaning, it indicates the need to set out on the path towards deliverance. The concern with inner calm is similar to a seed (growing into) limpid clearness and consummate perspicacity. The impassionateness found in having dismissed from one’s mind one’s involvement in this lifetime becomes the
instrument of escaping from Samsāra. The desire for lasting limpid clearness and consummate perspicacity is like water and manure. Separation from excitement and emotional disturbances presents itself as the information that unfavorable conditions have been phased out by themselves. Visionary experiences and devotion are the spontaneously present cause for the increase of the crop that is wholesome and healthy. Mental stability and a deep sense of reverence quickly ripen the fruit of the path towards deliverance. (A man in whom all this is taking place) is known as a most worthy vessel.¹

To ensure the realization of the goal it becomes necessary to follow certain ‘guide-lines’ which seem, at first glance, to be suggested from outside, but which actually are already built into the ‘system’ presented by a human being, and effectively function in it. Such ‘programs’, which act like control centers, are known in anthropomorphic terms, as ‘teacher’, ‘spiritual friend’, and, going beyond this anthropomorphism, as ‘the real Guru’ (bla-ma dam-pa), who is none else but Mind-as-such (sems-nyid) which may be likened to an ever-present non-reflective input into the reflective level, the noetic-noematic complex (sems) which is but a manifestation or reflection and a condensation of the former.² The implication is that, at all times and simultaneously, there is at work a hierarchy of levels.

The hierarchical order of levels of dynamic processes, by which a human existence (‘system’) becomes ever more richly orchestrated, is found, socially as well as spiritually, in the ‘three constraints’ or ‘regulatory norms’ that guide man to relate himself to a reality or world in whose shaping he is incessantly participating. These ‘controls’, ‘norms’, or ‘constraints’, seen in their social application, refer to the Srāvaka who pursues a certain goal that remains strictly within the human dimensions of subjectivity; to the Bodhisattva whose goal takes in not only the world within him but also the one around him, particularly in interpersonal relationships; and
to the mystic who attempts the short-cut of tuning in to the reality that embraces and goes beyond the human world.3

A person who desires the Śrāvaka enlightenment abides by the constraints that go with the social types summed up by the term prātimokṣa;4 who desires unsurpassable Buddhahood to be realized within three or more aeons of countless years, trains himself in the constraints that mark a Bodhisattva; and who desires Buddhahood quickly within his lifetime abides by the constraints that characterize the mystic way. These three disciplinary norms are termed 'foundation' because qualitatively they form a hierarchy while designatively and denotatively they are different.

But man is not just a social being; he is also a spiritual being bringing into play cognitions, insights, and interpretations, and there is interaction between his social and spiritual being. Viewed 'spiritually', the constraints operate as

the constraint on the level of the prātimokṣa, that is, not to have the mind contaminated by emotional disturbances, the unhealthy and unwholesome; the constraint on the level of a Bodhisattva, which is to act on behalf of others in such a way that the healthy and wholesome is in a continual flow; and the constraint of the mystic, to have the bitendential value of Being (don-gnyis) spontaneously present by transfiguring oneself and the other (persons and the world) into deities and divine mansions, and to convert the reality values into the path of growing.5

The hierarchical order is such that the higher level constraints contain the lower level ones and, as is obvious, a lot more. Unless one's mind is kept free from emotional disturbances which distort our vision and make us see quantities where there should be (and actually are) qualities, it is not possible to recognize another person's value and act in such a way as to have this value kept alive. Unless one is able to perceive the value of Being, be it at first only in another
person, it is not possible to be aware of one's own intrinsic values. Since this is not a state of invariance or conserved quantity, it operates in both directions: to the extent that I can see myself as valuable (‘divine’ or as a god or a goddess), I can see value in the world around me (others as gods or goddesses and the world itself as a divine mansion or a realm of exquisite beauty).

These levels or constraints do not apply to separate individuals, but operate in a single person moving in the direction of his real Being. Each person, taken separately, merely represents the actualization of any of the particular phases in this hierarchically ordering and ordered process. In other words, in view of the complexity of man, the ‘three constraints’ indicate applicable alternative patterns correlating with different sets of purposive acts by which a person defines himself as being of this or that type in face of a given challenge. The determination of which alternative should be applied in a situation which stimulates the application of constraint is a function of the particular competence of the individual. Inasmuch as these patterns are alike in setting up necessary restraints which are of a self-regulatory, goal-directed nature, there can never be any question of discarding restraints. Anyone irresponsible enough not to bother about the foundation of his growth will completely fail.

Lastly, growth starts in the person willing to grow by appreciating the uniqueness of his status as a human being. This is not ego conceit, because a person who can recognize himself as a human being also recognizes himself as part of a larger order. Precisely because he is ‘subjective’ he can also be ‘objective’, seeing value wherever it is. This the ‘merely subjective’ egotist is unable to do.
S
d second, the person who is going to experience for himself (life’s meaning) 
Must be one who has confidence, \(^6\) perseverance, 
the desire to escape (from his present situation) and 
the feeling of disgust (with it).

Wearied of Samsāra, he must deeply concern himself with liberation, 

Dismissing this life from his mind and looking to 
limpid clearness and consummate perspicacity henceforward, \(^7\)

Keeping excitement and distraction far away and 
having few emotions, 

Being contented, leisurely, having visionary 
experiences, and being full of dedication, 

Having a firm mind and a deep sense of reverence, \(^8\) 
[Such a person will realize most excellent liberation]. \(^9\)

He will have served, in the best possible way, a 
competent teacher, 

And so have cultivated and refined his own mind by 
listening (to the words), thinking (about them), and 
making a living experience (of them), and, 

In particular, he will spend day and night in 
continuous effort 

To follow the instructions of what is the quintessence of 
the oral transmissions. 

Not being distracted for a moment by trivialities, 
He will strive for true individuality.

Not infringing the three status obligations of 
The Śrāvaka, Bodhisattva, and mystic, \(^{10}\)
He will control himself (so that) what is profitable to others will be realized, 
And he will turn whatever appears into the path towards liberation.

B2 The beginner must primarily realize his own value: 
In solitudes he must guard his mind, keeping excitement and distractions away; 
Avoiding unfavorable conditions, he will have his emotions controlled by their counteragents.

B3 Not letting his vision and his actions contradict each other, he must pay attention to his contemplation and, 
Tackling any of the five poisons that may arise within him, at that very moment, 
By inspective attention, he must apply its counteragent directly.

B4 Conscientious about his actions by body, speech, and mind, and aware of them, having self-respect 
And demonstrating decorum, he will refine himself.

B5 He has to be indifferent to praise or blame, approval or disapproval, fame or infamy, 
These being but a phantom, a dream, with nothing to them. 
He must contemplate them and accept them as if they were an echo, 
And he must cut the mind, with its belief in an I or a Self, at its root.

B6 In brief, in not letting whatever he does contravene the meaning of life, 
He must control himself and not harm others and, 
Without for a moment giving in to the emotions,
It is imperative that he spends day and night in (applying himself to) what is healthy and wholesome.

Nowadays, in these evil times, it is most important That an unregenerate man realizes his own value in solitude.

Just as a bird with only one wing cannot rise into the sky,
So without higher perception another's value cannot be perceived.
You must think about what is helpful to others by being cognizant of your own value.\(^{31}\)

It is imperative that you realize (yourself) without having your mind deceived
By the deception and trickeries perpetrated by Death (in the guise of) excitements and distractions.

Be not distressed by worries about when you might die.

Therefore, you have to pin down mind today;

Look where you would be carried away, if you were to die today.

If you were to spend day and night in the welter of excitements
Without having a hold on when you are going and what you are becoming,
Your being a unique occasion and the right juncture would be meaningless and a mere waste.
Alone and in solitude, contemplate what is meaningful.
Now is the time to take good counsel:
What will there be for me when I have to go at the moment of death? Therefore, this very moment make efforts.

C₈ The deceptive appearance of Samsāra resembles a frightening footpath. Impress upon your mind the necessity to find a means to be delivered from it. If you were to go astray now, you will go further and further astray in the future. Therefore, exert yourself and take (this need) to heart.

C₉ In the boat of a unique occasion and the right juncture, cross over the ocean of emotionality, the belief in a Self, which is so difficult to cross.

C₁₀ Realize prosperity and bliss through efforts from your very heart, While there is this rare opportunity of the road to liberation, the highway to limpid clearness and consummate perspicacity Presenting itself through the power of your mind.

C₁₁ Life is not permanent and changes every moment— The wise (know that it is) vitiated by excitement and (only fools) postpone striving for what is healthy and wholesome. When going astray has become the norm through one’s having been accustomed to it for a long time, The crowd of emotions turns up at every moment quite naturally.

C₁₂ But since it is difficult for them to rise when you strive for merits and for what is wholesome, It is imperative to strive to repel the motivating power of karmic actions.
In the realm of Samsāra there is no happiness whatsoever;
If you think about the misery of fictitious being, it turns out to be unbearable.
Now you have to start with the means to liberation.

If you do not strive from the bottom of your heart for life's meaningfulness,
There will be no profit in your having what makes you a unique occasion and the right juncture.
Therefore let your disgust with what is impermanent grow ever stronger,
And, not being distracted for a moment, put sustained effort into your realization.

Thus, if you have understood this from the first,
The citadel of saintliness will afterwards be quickly reached.
Once your own value is established, that of others comes up naturally,
And the supreme path towards liberation from the realm of Samsāra is found.
Therefore, when whatever you do is in harmony with life's meaning,
You are an individual who has become the site for the realization of limpid clearness and consummate perspicacity.
Once the need for realization, deeply embedded in a living person (though not always responded to), has been felt, it seems to tend to make the person rush into this venture of finding himself. However, unless a proper foundation has been laid, the venture is bound to suffer shipwreck, often before the boat has even left harbor. It is for this reason, to avoid possible dangers, that the 'preliminaries' occupy such an important place in the process of growth, in what man must do in order to find himself through what may be called his real Being.

These 'preliminaries' present a hierarchical order of widening scope, already geared to bringing about the experience of a more satisfying reality. There is, first of all, the awareness of the transitoriness of life which impresses upon us the necessity to act now. Time is running out, and it is a mistaken belief that there may be a second chance. Transitoriness is not only observed around us as something that is just 'out there', but also applies to each of us and evokes the feeling of frustration culminating in disgust with all that is
transitory and makes up our ordinary world. At the same time this feeling is the ever deepening knowledge that whatever is transitory cannot serve as a solid basis for shaping and finding meaning in life.

This knowledge is dialectically related to the manner in which we act in the face of the transitory. Action thus becomes compassion. Unlike activism with its inconsiderateness and disregard of responsibility, and unlike sentimentality with its hollowness and lack of genuine feeling, compassion as action (thabs) is dialectically related to the activation of the ethical impulse, which is ‘value’-cognition (shes-rab) because of its being appreciative of the principles that govern human relationships as these progress to an optimum level. Still, there is a wide frame of reference. Action, which as the inner vitality of man is characterized and qualified as ‘compassion,’ becomes—in view of the ramifications in which it may manifest itself—a kind of ‘experimenting’, while ‘appreciativeness’, as its inseparable ‘value’-cognition, frees us from the impasse or fixation into which ‘action’ alone might lead, and brings us up to higher levels of our being to which we refer as being states of meditation. This would not be possible without ‘experimenting’:

Since without action appreciativeness is not born,
At first search for meditative states by means of various actions.1

‘Action as compassion’—experimenting with more or less concrete situations—determines and defines. ‘Appreciation’, on the other hand, is not restricted to any one situation or appraisal but rather opens up the fixed framework. Their interaction, illustrated through the images of the masculine and feminine, guides one to ‘act’ in consonance with ‘appreciation’. And the first instance of this interaction is the emergence of ‘ethical man’ who, in being aware of the value he himself constitutes and presents, becomes increasingly aware of the value of others which he concurrently strives
to bring out. This can be done because, in value-cognition and value-oriented action, the dualistic separation between 'subject' (as an ego-encrusted isolation) and 'object' (as a statistically random plurality)—between one person and another, between men and women, between the masculine and feminine—is dissolved by one's understanding. This occurs through a growing kind of sensitivity and openness, the unity of the internal factors operating in the unfolding of what gradually has become one's dualistic world in and through which one is divided and suffers.

It is here that the 'empowerments' (dbang) fulfill an important role, inasmuch as they aid the person in re-discovering himself by clearing away the ego crust and opening up access to the inner creative forces. The English rendering, 'empowerment', refers to only one feature of the graded and complex process of man's deepening understanding of himself. The Tibetan term is understood as implying both 'catharsis' and 'empowerment'. This ambiguity reflects the fact that the term refers to an experience of a unity which only on the reflective and descriptive level can be separated into two features. Furthermore, 'empowerment' is something like a 'forward' movement in linking up one level to the next higher one, so that by being in this process one also is the whole process. The important point to note is that all this is available within ourselves in the specific sense that 'within' is not merely the opposite to 'without', but that both 'within' and 'without' are merely surface phenomena that drag us further and further downward within something still deeper and more encompassing which defies any predication or reduction to something pre-established, be this in the manner of an essence or some other postulate. In other words, the 'empowerments' emerging out of the open dimension of Being operate through a context of encounters out of which, on the reflective level, holistic views of ourselves and our world arise with an ever increasing emphasis on quality and unity.
Chapter Three

The 'Developing Stage' is initiated by the emerging quality—which is as much observed 'without' (in the external world) as it is felt 'within' (through the exercise of imagination)—as the application and execution of a plan, going beyond the 'obvious' in a creative way that is appropriate to the cultivation of man's very Being. Through this stage, the answers implicit to such questions as “Who am I?”, “Where am I going?”, “Why am I here?”, are intimated, simply because insight has thus been gained into the difference between the state in which we are cut off from Being and the state in which we are attuned to Being. To see ourselves as a god or a goddess is not a deification of man (which merely reduces the intrinsic value of human beings), but is rather a recognition of the value of Being and a rediscovery of the creative forces that shape us.

The 'Fulfillment Stage' is indicated by the unity of the within and the without which is felt, rather than judged propositionally—although to the reflective mind it presents itself as the paradox of there being something while there is nothing. This stage, being of a higher order, 'reaches down' into the lower order 'Developing Stage', and, with a shift of attention, both stages enter a new unity.

Actually, both stages are always together, and it is merely a matter of emphasis whether the 'experimenting' that goes with the Developing Stage or the 'appreciation' that is experienced in the Fulfillment Stage, is in the foreground. The path towards Being cannot be travelled in a one-sided manner. The internal logic is that there can be no 'appreciating' without 'experimenting'.

The 'preliminaries', then, open up communion with Being of which each of us is a presentation and which is encountered by each of us in specific ways. Although 'preliminaries', they are essential for the return to and rediscovery of that state that had been ours before we became alienated from ourselves by 'going astray' into worlds of frustration, where the 'light has gone out' and where we
become more and more 'divided against ourselves'. However, these preliminaries are never an end in themselves.4 This 'state before'—to use a rather unusual index—is referred to by various terms such as 'self-existent pristine cognitiveness' (rang-hyung ye-shes), 'pure awareness' (rig-pa), 'naturalness' (gnyug-ma), and 'togetherness' (lhan-cig-skyes-pa).5 But these descriptive terms as well as their conceptual translations are faulty because the 'state before' is precisely one into which concepts (even that of 'state before') do not and never have entered. Therefore, no concept whatsoever can do justice to that which is actually involved. Even if we were to say that what is meant is the feeling of not being divided against oneself and the rest of the world, or of 'lighting up with joy', this is still to have recourse to concepts. Since we cannot do without concepts, all we can do is to be cautious not to confuse the concept with that to which it merely points:

Although the fuel is not the fire itself, we can see it blaze forth from the fireplace; similarly, although the triad of pleasure (bde), radiance (gsal), and non-dividedness (mi-rtog) is not really this pure awareness, self-existent pristine cognitiveness, natural (mind), cognate (pristine cognition), it can be known by those who receive the Guru's instruction and who have the necessary devotion, from that which is indicated by 'bioenergetic level' which is pleasure, motility which is radiance, and the live structure (of flow-patterns) which is non-dividedness, (and which is taught) so that one may apply oneself to experimenting (with them).6

Although 'bioenergetic level' is essentially a term belonging to the realm of physiology and medicine, its use in this context is appropriate because it is equally the sustaining and creative force in personality from which health (even in the narrowest sense of the word as the state in which 'animal' functions are duly performed) and thought (in the wider sense of the capability to undo the perverted ego-limitations and restore the richness of man's 'inner' world) derive. It is,
therefore, the same as the 'thrust towards Being' which, quite literally, means to rediscover the optimal level of operation and which also is man's 'basic existence' from which he is prone to alienate himself. This direct feeling of 'being'—what it is like to be fully awake, to be alone and yet to be all—is named after the feeling that accompanies the occurrences where we are at our best—'pleasure' (bdel-ba). Therefore, pleasure is a mode of being perceived and known as a state of being fully alive and, as such, underlies any experience that we would claim to have a positive quality. However, as a judgment such a claim is already a limitation of the truly 'positive' character of pleasure or being, inasmuch as it has now become contrasted with 'negative'.

Closely related to pleasure is 'motility' (rlung) which carries waves of excitation which, although they are felt as 'pleasure', are also inputs of bioenergetic information. In being carried throughout the 'body', these inputs are being 'decoded', and it is here that 'something may go wrong', so that what may contribute to the overall well-being of the system becomes its restrictive and debilitating agency. This observation has led to the distinction between 'motility as the carrier of (and the movement informed by) pristine cognitiveness' (ye-shes-kyi rlung) and 'motility as the carrier of karmic activity' (las-kyi rlung) which is informed by 'mind' (sems) as ego-centered purposing.

Although they are the same as far as movement is concerned, it is by virtue of movement along non-twisted conductors that motility becomes 'motility as the carrier of (and informed by) pristine cognitiveness', and it is known as such because its function is to display pleasure, openness, and radiance. But by moving along twisted conductors it becomes 'motility as the carrier of karmic activity'. Its function is the emergence of such deficiency experiences of motility as sundry dividing concepts, various unhealthy and unwhole-some enjoyments, lack of radiance, depression, elation, obfuscation, and vertigo. As is the case with a changeling who
may, when infuriated, become a tiger, but if not, remains a human being, so also the effulgence of absolute cognitiveness ('informative input') and motility moving along the conductors in the body are identical; it is in view of the distortedness or non-distortedness of the conductors that it becomes the horse ('carrier') of pristine cognitiveness, the cognitive capacity operating appropriately, or of karmic activity and emotional imbalance, (the cognitive capacity) not operating appropriately.9

Motility, carrying waves of excitation and information, is observed outwardly, and felt inwardly, as 'radiance' (gsal-ba). To this we refer by saying that somebody 'shines with joy' or 'glows with pleasure'. This glow and radiance, the more intense it becomes, turns into sheer lucency, from which it originated in the concrete individual.

Motility is continuous with the patterns or conductors along which it flows. As such, these flow patterns exhibit a certain order that derives from 'within', in the sense elaborated above, and proceed from the non-manifest continuum towards increasingly discrete particulars. Their configuration represents a system of a highly complex, self-organizing and self-manifesting kind. These particulars, known technically as 'conductors', 'flow-patterns', 'circuits' (risa) are to be understood as functionally, not representationally, true and relevant to the subject as a live person who is constantly 'decoding' the messages that are sent out. As has been pointed out earlier, in this 'decoding' process conflicting features may enter, which eventually lead to emotional imbalance in and cognitive distortion of the continuum of Being, of which the living person is a concrete presentation. 'Non-dividedness' (mi-rtog-pa) is but the connectivity of the 'flow-pattern system', which is both 'knowing' and 'known' in a non-partitive manner to which we refer as being 'beyond subject and object'.

Pleasure, radiance, and non-dividedness are 'facts' as they are perceived and interpreted by cognizant human in-
dividuals, but they are also 'values' inasmuch as they are made dynamic qualities of the cognizant human individual. This emphasis on 'lived values' is central to what is meant by 'meditation'.

Two tendencies, however, seem to operate in every living organism which, as has been noted, is characterized by a constant openness of its boundaries which makes the operation of these tendencies possible. One tendency which is of primary importance develops towards higher levels of organization involving optimal value states by making use of negentropic input. This tendency is furthered by 'meditation' as a means of 'tuning in' to the openness of Being. The other tendency is 'entropic' and develops towards a final state of rest or death. The entropic character of this tendency is inherent in the sense that this process becomes ever more statistically repetitive. In terms of the reflective ego, this means that we may try to pursue intrinsically value-optimizing facets of Being (such as pleasure) which we have nonetheless consciously misapprehended by seeing them 'out of context' and as an 'end in themselves' and of which we consequently engage in repeat performances (that are also euphemistically called 'meditation'). Alternatively, we may merely descend into and persist in a state of random fluctuation and ultimate disorderliness. However, precisely because of the fact that living organisms are open systems—and man is no exception—there is always present and operative the other trend towards higher levels of organization. To make use of it is to mend our deficiency which, rather than being an inescapable 'state of fallenness', is a challenge strictly within ourselves.
Third, there are three steps concerning that which is to be experienced: The preliminaries, the main body, and the summary.

First, the preliminaries will be shown:

Awareness of transitoriness and disgust with Samsāra are the external preliminaries; They thoroughly dispel the preoccupation with this life.

Compassion and the activation of the ethical impulse are the special preliminary; They make everything travel along the path of the Mahāyāna. Therefore, at the beginning, cultivate these two preliminaries.

After them come the most sublime preliminaries:

The exercise of the Two Stages, after having received the empowerments in full; When one (experiences) one’s own body transfigured as a god and the world and its beings as gods (and palaces), The involvement in vulgar beliefs is dispelled.

When one cultivates the profound path, the communion with the Guru, Immeasurable waves of spiritual sustenance arise from the power of compassion.
All hindrances are removed and the two kinds of rewards (for one's spiritual efforts) are obtained. Therefore, the two sublime preliminaries have to be cultivated.

Thus by these four topics making up the preliminaries, Mind is set on the unerring path, and,
The sublime path towards liberation having been taken hold of, the experience of Being comes quickly.
It becomes easy to cultivate the main features (of what is to be experienced), there are no obstacles, and There are capabilities without limits such as coming ever closer to the rewards (of one's spiritual efforts).
Therefore it is of utmost importance to cultivate the preliminaries.

The main body is about 'pure awareness', encountered In the experience of Being by means of 'meditation' involving pleasure, radiance, and non-dividedness. As sheer lucency, a pristine cognitiveness, defying any propositions about it. It rises in naturalness and togetherness.

First, there is the encounter by means of 'pure pleasure': After you have pursued the preliminaries as indicated above, 11 (You have to imagine) three 'conductors' in the manner of three pillars in the midst of four 'control centers'; The 'conductor' to the right is white, the one to the left red, and the central one deep blue.
Its upper end extends to the cranium, its lower end to the perineum.
Within the central 'conductor' directly in front of the 'navel' region, there comes from its syllabic symbol A A blazing fire that makes 'nectar' 12 flow down from the syllabic symbol HAM in the head.
This nectar fills all the four central centers and the whole body.
When the feeling of pleasure becomes pervasive, there flows down to the syllabic symbol vam in the heart region.
The 'nectar' of the ham in an incessant stream.
This one has to cultivate until the experience of pleasure has set in.
Then even the vam becomes smaller and smaller, and subtler and subtler,
And (finally) settles in a field (of feeling) that defies any propositions as to its three kinds of objective reference (i.e., a-ham-vam).
When by this means the mind has been taken hold of, there comes an inner calm through pleasure.

After this, the mind, having passed beyond whatever can be thought or talked about,
Rises as this field that is similar to the (clear) sky, free from the intellect's ruminations.
This is sheer lucency, complete and perfect as pure pleasure and openness,
Meaningfulness that in its pellucidity cannot be encompassed by ordinary thought.13

Once you have become familiar with it, there come four experiences:
Everything that is presented (to the mind) is (felt) to rise in pleasure;
Day and night, you cannot be torn from this reach and range of pleasure;
Tribulations like attachment and aversion do not upset you;
There is born an appreciative understanding that brings together words and meanings;
By further cultivating this there rise, like the sun, in your mind,
Chapter Three

Unfathomable capabilities such as visions and higher cognitions.
This, then, is instruction in the most profound.

Second, there is the encounter by means of ‘radiance’:
The preliminaries are as before, by imagining how at their lower end the right and left conductors,
That have been made to glow, enter the central conductor;
And how their upper ends enter the nostrils, and then
By blowing out (through them) the waste from ‘motility’ three times, the demons of disease and the obscurations by evil disperse.
Drawing in the breath slowly three times, (you have to imagine) the whole world (stationary and moving), (first)
To dissolve in a pure light, which is then drawn into your self through the nose, and which Enters the central conductor from those to its right and left; and (then imagine) the pure light to settle in the center of the heart in the hues (of the five pristine cognitions), and finally
To dissolve in a globule (of light).
Holding (this light) as long as you can, You should take a little time to discharge the union of the upward and downward trends of motility.
It is most important that inhaling and exhaling are done slowly.
Moreover, you must not let the capabilities such as those inherent in (this emergent) Buddhahood Become dispersed into any place, but you should let them dissolve in the heart.
By this means the mind is steadied in its radiance and pellucidity.

Thereafter, you have to imagine how the light from the heart’s light
Encompasses the whole universe by its outward spreading
Which starts from the blaze within the four control centers within the body.
When you practice this day and night for some time,
Dreams cease and manifestations of light set in,
And you see the within and the without engulfed in a light of five colors,
Which (come in intensities of) the rising moon, a shining lamp, a firefly, a star, and so on.
When the mind is firmly settled in this range of radiance, inner calm is born.

Then when you gather in the light again and let even the light of the heart become smaller and smaller and subtler and subtler in the reach and range of openness,
There rises mind in radiance and pellucidity and openness with no referential point whatsoever in it, as sheer lucency that in itself is free from any limitations by propositions about it.

This is natural pristine cognitiveness in its radiance and openness;
It is the experience of Being in its natural completeness.
Once you have become accustomed to it there come four experiences:
Whatever is presented (to the mind) is felt to be a shimmering, wide-open lucency;
Day and night you stay in this range of radiance;
Mind in its radiance and pellucidity is not upset by dividing concepts;
And there is an appreciative awareness that is expanding without noematic-noetic interference.

Further, by becoming accustomed to it, there arise these capabilities:
To see clearly what lies behind the screen, as well as
To have higher experiences.
This is the essence of a still profounder instruction.

Third, the encounter by means of ‘non-dividedness’:
The preliminaries are as before; the main procedure has
three facets:
Projecting, fixing, refining.
‘Projecting’ means to let the sheer lucency which is
Mind-as-such,
Like (the syllabic symbol) ा or a globule of (five-colored
light) in the heart,
Depart from your head far up into the sky
As you vigorously exclaim ‘हा’ twenty-one times.
The moment body and mind become thoroughly
relaxed and composed
In the range which becomes ultimately invisible, the
higher the projection is effected, and
The flow of divisive concepts is stopped.
You stay in a range that cannot be expressed in words,
however much you might try;
Even its experience is such that nothing is to be seen (as
something), passing beyond the reach of thought.

‘Fixing’ is to turn your back to the sun
And steadily gaze at the clear sky;
And when, unnoticeably, the movement of ‘motility’
becomes calmer and calmer,
Non-dividedness, defying any propositions, wells up
from deep within,
And an experience as open as the sky is born naturally.

‘Refining’ means, while keeping the eyes steadily fixed
on the sky,14
To imagine how out of the range in which mind is
radiant, neither forging ahead nor withdrawing,
Earth, stones, mountains, rocks, and the whole animate and inanimate world
Becomes one with the wide open sky.
Your own body is felt to be without grosser matter,
Mind and sky are in a state of indivisibility, and
There is no stirring of the without, within, or in-between.
When body and mind have relaxed in this range of the sky,
There is this reach and range in which subjective thinking with its attending and intending has become calm;
Let mind, no longer forging ahead nor withdrawing, settle in its place.
At that time meaningfulness, mind beyond words and thoughts,
Arises as (ultimate) intentionality like the sky, non-dual;
This is the very essence of all the Buddhas of the three times.

Once you have become accustomed to this there are four experiences:
Whatever is presented (to the mind) is free-flowing, there being no gross conceptual articulations;
Day and night you cannot be separated from this range of non-dividedness;
The five poisons have become calm by themselves and the mind's stream is gentle and mild;
There is the felt experience of everything being like the sky.

Once you have thus become accustomed to non-dividedness as the third means,
Wider visions, higher cognitions, holistic feeling, and (Buddhahood) capabilities set in,
Appropriate action and appreciative discrimination, inner calm and wider perspective enter into a unity, and through them, incidentally as well as ultimately, the most excellent bitendential value of Being is realized.

In the summary there are four sections: The experience itself, bringing out its worth, its understanding, and the climax.

From among the two kinds of experience, the one without flaws has been discussed above.

The one with flaws derives from compulsive addiction to each of (its) three facets: Addiction to 'pleasure', to 'radiance', and to 'non-dividedness'; Compulsive addiction to (each) as an end in itself, their reversal, and their being mixed with 'poison' are their three flaws.\textsuperscript{16}

Reversal of 'pleasure' involves a drop in the bioenergetic level, libidinous urgings taking precedence, A feeling of discontent, listlessness, and the desire to think in terms of objectification.

Reversal of 'radiance' is increase in palpitation, prevalence of irritation-aversion, A hardening of divisive concepts, perplexity, and reluctance to be at rest.

Reversal of 'non-dividedness' is dullness and lusterlessness, and Mind becomes depressed, drowsy, sluggish, and inarticulate.
Thus one has to tackle any deficiency, whether it is due to an inherent propensity or downright entropic, and to mend it by means of the appropriate counteragent. To bring out the full worth (of the experience), one has to mend its deficiency and deepen the experience.

There are three ways of mending the deficiency: A person (of highest intelligence) does so by insight: He knows all that is postulated by the intellect to be like an apparition, having no essence whatsoever that could be grasped; To be like the one overarching sky, to have nothing to boast of, and to be nothing by themselves; And he passes the verdict on them that they are of the sphere where no compulsive addiction obtains. Pitfalls and obscurations become the experience of Being; Obstacles spur him on toward what is healthy and wholesome, and unfavorable conditions aid him to limpid clearness and consummate perspicacity; On the ground that is pure pleasure, his mind (operates) constantly in a state of pleasure, And an understanding comes that is like the sky unlimited.

A person of mediocre intelligence mends (the deficiency) by contemplation and bringing out (the mind’s) pellucidity. He catches (it as in a snare) and holds it by attentive inspection, And installs it in the sphere of ‘pleasure’, ‘radiance’, and ‘non-dividedness’ where there is no distraction. Since distraction, and the failure to catch it, are a defect, it is imperative to have (the mind) every moment in the reach and range where no distractions occur.
When there is a reversal of pleasure he should imagine that
A blazing fire starting from the *hu* in the 'energy reservoir'\(^{19}\) consumes all grossness in his body
And cleanses and transports him into the range where there is nothing concrete.
This procedure applies also to cases of illness and obsession.
Having broken the clinging to 'pleasure', he should contemplate 'pleasure' as an open dimension.
As he increasingly scrutinizes the mind in which libidinous urgings stir, it is then,
When this mind is installed in the sphere where neither hope nor fear nor anything contrived or adulterated exists, that
Libidinous urgings are resolved by themselves, and a pristine cognition that is pure pleasure and openness (together) arises.
Discontent is a defect that comes with a decrease in 'bioenergetic input';
(Against it) he should contemplate a 'setting' which is felt as 'pleasure' flowing (because its frozen state has been thawed) by a blazing fire.
If there is deep depression, this is the fault of condensation not having been separated from radiation.
(Against it) he has to straighten his body,
Start deep breathing and filling the heart with 'light'.
By contemplating the world of appearances as well as the ideas about it as filled with light and as radiance-openness, (depression) is resolved.

In order to weaken the clinging to 'radiance' he has to practice absolute non-subjectivity.
When there is the reversal of 'radiance', that is, lusterlessness, he has to contemplate mind as pellucid and radiant.
When there is rapid palpitation or restlessness (of the mind), he should close his eyes and in his heart Contemplate lucency or a syllabic sound symbol or a lotus, a sword, a cross, And should let any of them, the lower these descend, the farther extend Until they hit the golden layer below. This is the surest way of dispelling (the reversal). When the prevalence of irritation-aversion is contained in its own course, It will dissolve in the mirror-like pristine cognition that is radiance-openness.

The rising of 'non-dividedness' is practiced by non-subjectivity. When the mind, on its threshold to dullness, is recognized as what it is and scrutinized, It dissolves at that very moment, and a pristine cognitiveness which is the continuum of meaning arises. When there is listlessness, sluggishness, and inarticulateness, He should contemplate the light in his heart as it comes out of the crown of his head And remains hovering in the sky above him. When the mind is held there, it stays divorced from all propositions. This is the instruction in the most profound topic.

In general, non-subjectivity is of utmost significance in each and every case. If there is no longer hope or fear, you are free from all hindrances. When Mind-as-such, openness and lucency, is installed in (its) sphere of pellucidity, Divested from the propositions about it, which are the concretization of the intellect,
You are certainly free from spiritual obstacles and do not travel wrong ways to be avoided.

Those of low intelligence in mending the deficiencies
Resort to three procedures: postures, diet, sympathetic magic.
Posture involves the seven items of the Vairocanābhisambodhi.  
Sitting cross-legged, with a fixed stare, breathing calmly,
Holding the hands folded, bending the neck slightly,
raising the tongue to the palate,
Lowering the eyes to the tip of the nose, and (thereby)
harmonizing ‘motility’ and ‘mentation’.
There being neither depression nor elation, an unfailing concentrative ‘setting’ is born.
Since all defects arise from the body’s vitalizing forces being upset, that is,
The ‘conductors’, the ‘motility’, and the ‘bioenergetic input’ being disturbed,
It is important to remain in a state of composure in which upsetting disturbances do not enter.
And since capabilities, in turn, arise when the ‘conductors’, ‘motility’, and ‘bioenergetic input’ have become the vitalizing forces without interference,
It is important to scrutinize these vitalizing forces.

From among other similar body exercises,
In particular, slowness, gentleness, and tranquillity are very important.
A person has to temper gentleness with impetuosity and impetuosity with gentleness.
And it is of utmost importance to have all that is involved suited to his temperament.
Specifically, with respect to ‘pleasure’ he must cross his arms,
Lower his eyes, and hold the mind on 'pleasure'.
With respect to 'radiance' he must lay his hands on
his knees,
Breathe slowly, and stare at the sky.
As for 'non-dividedness', this is achieved by the seven
items (mentioned above).

Diet means to rely on what is beneficial to the
experiences such as food and drink
At places suited to the seasons and in company.

Sympathetic magic is to preserve one's bioenergetic
level by tying round one's waist
A charmed cord that consists of three threads woven
By a virgin, in case of a drop in the bioenergetic level.
When there is a rush of dividing concepts,
non-dividedness is established
By using a pill made of sandal, saffron, and excreta;
And when there is dullness, holistic feelings are assured
By pills of saffron, camphor, and 'hormones', so a
Tantra says.22

If a person is to deepen the flawless experience of
'pleasure', 'radiance' and 'non-dividedness',
The best thing to do is to keep the mind to any
objective reference.
First, he has to contemplate while depending on the
objective reference;
Thereafter he moves automatically into the
non-referential range.
Since this is the most profound and sublime procedure,
The fortunate one must comply with it.
To dismiss it because it starts with a specific
characteristic is the way of fools;
Their's is to be dismissed as a bad method as no
experience whatever is ever felt (to arise).
In particular, to bring out the real value of ‘pleasure’,
He has to stop the downward movement of ‘motility’
and to have it fade upwards in the bioenergetic input, starting from the perineum
And dissolving in the crown of the cranium,
And then to install (this feeling) in the reach and range
where there is no objective reference.
Afterwards when the union of the downward and upward movements has been taken hold of
And the mind, concentrated on the heart, becomes
installed in the sphere where there is no origination
of (subjective thoughts),
This is the presence of ‘pleasure’ and ‘radiance’
divorced from all propositions about it.23

From time to time the person should watch this ‘energy movement’
(Assuming the forms of) a descent, a turn-about or a pulling up, dispersal, and a finalizing,
Like the lithe shaking of a lion.

‘Descent’ is like his raising the upper part of his body
and pressing down the lower one
In the union with his imaginary consort in embrace,
By pulling the ‘creative energy’ from the ham
And letting it descend into the genital region he fixes
the mind on ‘pleasure’.

‘Turn-about’ is to pull this downwards movement upwards:
He places both hands on the groin,
While pulling up the downward movement the tongue is made to touch the palate;
The white in the eye is turned up and, with neck and head quivering,
He imagines the bioenergetic input, like a tightened rope (being pulled in), to
Fade in one vital spot after the other, up to the crown of the head.

'Dispersal' is agility of hands and feet (as in) preparing bow and arrow for shooting; The breath is let out with a hissing sound, the tip of the tongue touching the teeth.

'Finalizing' is to lie supine and be completely relaxed; Not to entertain any concepts nor to hold to anything, And to be in a state where no propositions naturally obtain. Thereby limpid clearness and consummate perspicacity which is pure pleasure without any impediments is set up.24

CIIb2 When one brings out the value of 'radiance' (related to) 'motility', The one, as for instance, gentle movement, is to bring out the other, as for instance, harshness; In particular, in the interaction between the within and the without, It is important that slowness and gentleness fuse. Although it has been said that many techniques have to be studied, Such as counting (the rate of breathing), the color, the temperature, and the shapes (breath may assume), (They are of no avail).25 The technique used here, where everything is achieved by a simple procedure, Is the king among the essences in the instructions.

When you have brought the body into the posture as discussed before, and, in particular, when there is no longer any eye movement, Breathing must proceed very slowly through the mouth and the nostrils,
And you must easily relax in the state of genuine freedom.
Mind must be made not to grasp anything.
Afterwards you have to lie supine, arms and legs stretched,
And, with a vigorous 'Ha', to let the mind rise to the sky,
And let it stay in its own luster without any distractions, there being neither a forging ahead to, nor withdrawal from, (its 'objects').
When 'motility' and 'mentation' are in a state of 'pleasure' that is free in itself,
There are no obstacles, and there are infinite openings for capabilities to arise.

The body feels light and no breathing movement is sensed; all propositions have come to rest, and Mind is radiant and pellucid and higher cognitions arise.
You can move with lightning speed, your complexion is shining, and holistic feelings grow.
There comes the indication that 'motility' and 'mentation' have entered the 'center'.
This most profound and sublime feature is a great secret.

Also, in bringing out the value of 'non-dividedness' which is like the sky,
Body and mind must be relaxed, and concentration must be on one topic.
The longer you look at this one topic in an undistracted manner,
All other divisive thought-constructs disappear in it.
When, even with respect to this topic, thoughts have fully ceased,
There comes an openness that does not hold what is present to be this or that.
This is the main point. Moreover, the following, too, has to be learned: Sometimes ‘non-dividedness’ is born from the ‘without’, as when breath is exhaled and becomes the objective reference; Sometimes it does so when, in a state of undistractedness, the objective reference is either within, or above, or below. Sometimes it is born when the cognitive capacity has nothing to rest on and stays in a state where there is no concretization of what appears to be (come) an object. This is ‘non-dividedness’ or the intentionality of the founding stratum of meaning. It comes by itself deep out of itself when this technique is used.

In order to bring out the real value of pleasure, radiance, and non-dividedness, it is said that The accumulation of merits and knowledge, the removal of the intellectual and emotional obscurations, the attention to the Developing and Fulfillment Stages, And the profound path, the communion with the real teacher, are the most excellent procedures. This is the instruction on the ultimate quintessence. Those fortunate ones desirous of liberation must take it to heart.

The understanding (of Being) that comes, when you have contemplated in this way, has one flavor that remains the same, as there is neither differentiation nor plurality in it. This one place in which the three approaches converge is like the ocean into which the various rivers flow.
Whichever approach of the three, 'pleasure', 'radiance', or 'non-dividedness' you may have practiced,
When the operations of the intellect have become quiet and subsided
In what is like the sky, unborn, Mind-as-such,
It is this very thrust towards limpid clearness and consummate perspicacity divorced from the propositions about its existence or non-existence,
That rises out of the depth (of Being) as sheer lucency, the sun of Being itself;
This is an understanding that need not be affirmed nor negated and that does not step out of itself, nor turn into something other than itself.
It is the very thrust of vitalizing (Buddhahood) which, like the sky, remains the same.

At that time, in the ocean of concentration in which inner calm and wider perspective spread
And which is well-focussed (on itself), pellucid and radiant without any turbidity,
All images, unlimited, without subjective distortion, are nothing as such
And enter into unity with the very facticity of the understanding of all and everything.
Whatever appears is like an apparition, nothing (in its ever felt presence), and not held to be this or that.
This vast intentionality, whose unity cannot be split, is sheer lucency that, originating from this facticity, comes out of the depth of (its) Being.

This self-existing pristine cognitiveness, (evoked through) the Guru's sustaining power,
Is seen when words and thoughts and talk have passed away.
To see it then as time
Is (the moment) when the three aspects of time are
no-time, and a 'before' or a 'later' can no longer be
distinguished.
It is called Prajñāpāramitā, Mādhyamika,
Zhi-byed, calming (the rush of) propositions and
suffering, Mahāmudrā,
rDzogs-chen, the very meaningfulness of
meaningfulness.
It is the experience of Being from its beginningless
beginning, in
Sheer lucency, Mind-as-such, self-existent pristine
cognitiveness.
Although it may be given many names, it remains the
one pure fact of Being as value,
Meaningfulness, defying words and thoughts about it,
and mind as limpid clearness and consummate
perspicacity.
Like the sky, where neither Saṃsāra nor Nirvāṇa exist
as something in a framework of duality,
This absolute completeness—in its remaining the same,
non-dual, divorced from the intellect,
Impartial, beyond the jungle of philosophical systems—
The yogis must know thoroughly
As the vast, unlimited Buddha intentionality.

The gradation in the climax, once the above have
reached their ultimate limits, is
That, incidentally, through the unity of 'pleasure',
'radiance', and 'non-dividedness',
There come illimitable capabilities such as wider vision
and higher cognitions,
And that, ultimately, Buddhahood (exemplified by) the
three founding strata of meaning is realized like a
Wish-fulfilling Gem so that
The bitendential value of Being is spontaneously
present.
When, through the merits of having explained in depth and width
The very meaning of life, the meaningful inner calm,
The two facets of limpid clearness and consummate perspicacity have been realized,
May infinite wealth accrue through the activity of the Wish-fulfilling Gem.

The above has been compiled according to his own experience
By the Buddhist Dri-med 'od-zer,
And for the benefit of future generations this clear presentation
Has been written down in Gangs-ri thod-dkar, an ornament of the mountains.

May those desirous of gaining freedom make every effort
And have an experience as stated here.
When the most excellent value of Being will have been realised by them, for the time being and ultimately,
They will quickly rejoice and be happy in the island of Pure Pleasure.
NOTES TO INTRODUCTION

1) ‘Buddha intentionality’ (sangs-rgyas-kyi dgongs-pa) is a key term in rDzogs-chen thought. On the meaning of sangs-rgyas, see Kindly Bent to Ease Us, part 1, p. 256 n.17, 274 n.3, and on that of dgongs-pa, Ibid., p. 261 n.6. Both terms are ‘descriptive’ of rig-pa which has been rendered by ‘pure awareness’, but it implies much more than a mere cognitive process. It points to the whole life process which is even greater than life itself. If rig-pa is seen dynamically as the input or inflow of energy in an open system (as is suggested by the term sangs-rgyas which could well be associated with the idea of ‘order through fluctuation’; see Erich Jantsch, Design for Evolution, p. 37 and passim) then dgongs-pa points to purpose and order and meaning in life. Such meaning reverberates in the various ‘founding strata’ (sku) for the various ‘founded cognitions’ (ye-shes). See Lung-gi gter-mdzod, 65ab.

4) This is the Yi-ge med-pa’i rgyud chen-po (in rNying-ma rgyud-bum, vol. 9, p. 366; rNying-ma’i rgyud bu-bdun, vol. 2, p. 220).
5) This is the Chos thams-cad rdzogs-pa chen-po byang-chub-kyi sems kun-byen rgyal-po (in rNyung-ma rgyud-'bum, vol. I, p. 143).

6) Ibid., p. 146.

7) Theg-pa'i mchog rin-po-che'i mdzod, II, p. 84. gSang-ba bla-ma-md-pa 'od-gsal rdo-rje snying-po'i gnas-gsum gsal-bar byed-pa'i tshig-don rin-po-che'i mdzod, p. 216. This text will hereafter be quoted in its abbreviated form of Tshig-don rin-po-che'i mdzod.

8) Tshig-don rin-po-che'i mdzod, p. 216.

9) The term 'evolutionary' is used in the sense elaborated by Erich Jantsch, Design for Evolution, p. 35 and passim.

13) Theg-pa'i mchog rin-po-che'i mdzod, II, pp. 76, 78, 79; Tshig-don rin-po-che'i mdzod, p. 228.

15) In rNyung-ma rgyud-'bum, vol. 10, p. 17; Theg-pa'i mchog rin-po-che'i mdzod, II, p. 83; Tshig-don rin-po-che'i mdzod, p. 216.

16) Klong-chan rab-'byams-pa discusses this point in his Tshig-don rin-po-che'i mdzod, pp. 217 f, in connection with the aids to implementing this 'setting'. Generally speaking, thoughts about solid food are dismissed as one learns to live more and more on 'spiritual' food. See also Theg-pa'i mchog rin-po-che'i mdzod, I, p. 503.

17) mkha'-gro snying-thig, part 2, p. 51. The Tibetan term translated by 'bioenergetic input' (thig-le) comprises both the 'physical' and the 'psychic', if not even more. In his Theg-pa'i mchog rin-po-che'i mdzod, II, p. 365, Klong-chan rab-'byams-pa defines thig-le as follows: 'thig means 'unchanging' ('unalterable') and le
'all-encompassing by virtue of its spreading far and wide'," and he distinguishes different operations by it, all of which occur in a continuum. With reference to the living body, thig-le is similar to what we call the 'genetic code' and its presence in every single cell. In the same work, I, p. 573, Klong-chen rab-byams-pa gives a further definition of thig-le as "surrounded by orbiting bands of five light values, radiant in themselves, a pellucid color (spectrum)." Both definitions taken together suggest the idea of an atom with its nucleus and orbiting electrons, the electrons being represented by (a) the orbiting light values, and the nucleus by (b) the energy of the orbiting values (intensities) as a constant. But it is also possible to think of thig-le as a 'code' and, since the dynamic aspect is so prominent, as a continual 'coding'. This input is then processed by 'appreciation' (shes-rab), which decides what is to be done with the information pouring in; and 'action' (thabs) then works out the 'problem', providing, as it were, the practical answer. The association of 'radiance' (gsal-ba) with 'action' is something like a process display device that shows 'how things are going', while 'pleasure' (bde-ba) related to 'appreciation' indicates the state of satisfaction with the uninterrupted 'input'. The definition of thig-le as 'unchanging' does not refer to something entitatively given, but to an utter 'openness'. See Rig-pa rang-shar chen-po'i rgyud (in rNying-ma rgyud-bum, vol. 10), pp. 206 f.

18) Ibid., p. 61.

19) mKha'-gro yang-thig, part 2, p. 172.

20) This is not to say that there are not more than four control centers. The number actually depends on which 'model' is under consideration. In mKha'-gro yang-thig, part 2, pp. 192 f, Klong-chen rab-byams-pa discusses from one to six control centers. Similarly, there is an infinite number of 'conductors' which in their interconnections act like self-reinforcing and self-maintaining loops, representing functional regularities, but only three or four are singled out for detailed discussion.

21) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 487.

22) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 507; mKha'-gro yang-thig, part 2, p. 155. In this work, on p. 156, Klong-chen rab-
byams-pa mentions a fifth 'control center' in the posterior end of the central axis (the pelvic region or perineum), termed bde-skyon-gi 'khor-lo, 'pleasure preserving control center'. As the name implies it seems to have to do with maintaining the needed constancy of the organism's interaction with the environment (internal and external). The required norm, here called 'pleasure', would then correspond to our concept of homeostasis. But since everywhere dynamic processes are involved, it might be more appropriate to speak of homeorhesis, a term coined by C. H. Waddington. See on this problem Erich Jantsch, Design for Evolution, p. 92 note.

23) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 535. See also Tshig-don rin-po-che'i mdzod, p. 59, 61, 139 ff. There are 'four' lamps, intricately interconnected, each of them indicating some deeper aspect of the process of experience.

24) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 487. This hierarchical ordering indicates a gradation which in terms of 'realms' may be explained as the 'objective' realm including body, speech, and mind, as these can be investigated 'objectively'; the 'subjective' realm which is dealt with in terms of existentiality (the feeling and conviction of being a subject), communication (the feeling and conviction of having something to communicate which is different from the mere noise of talk), and spirituality (the feeling and conviction of being more than a rigid model turned myth); last, there is the 'totality' realm which is neither of the foregoing but comprises both. This triadic hierarchy has certain affinities with the triadic approach offered by Erich Jantsch, Design for Evolution, p. 92 and passim.

25) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 491; see also pp. 496, 497. Tshig-don rin-po-che'i mdzod, p. 129.

26) Ibid.

27) Theg-pa'i mchog rin-po-che'i mdzod, II, p. 492 f.

28) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 492; see also Tshig-don rin-po-che'i mdzod, p. 130.

29) Theg-pa'i mchog rin-po-che'i mdzod, I, p. 494.
30) Ibid.

31) Theg-pa'i mchog rin-po-che'i mdzod, 1, pp. 502 f.

32) Tshig-don rin-po-che'i mdzod, p. 135; see also pp. 72 f. Another term for rang-bzhin, 'actuality' (which is, as it were, the link between the 'other side' and 'our side'), is gnyis-med 'nonduality', illustrated by the image of a mirror and the reflection of a face in it, sleep and dream, and a river and its waves, in Lung-gi gler-mdzod, 70a.

33) mKha'-'gro snying-thig, part 1, p. 61; mKha'-'gro yang-thig, part 2, p. 172. Theg-pa mtha'-dag-gi gsal-bas byed-pa Grub-pa'i mtha' rin-po-che'i mdzod, p. 366. Inasmuch as, according to Lung-gi gler-mdzod, p. 104b, the 'conductors', 'motility', and 'bioenergetic input', belong to the realm of imagination which is the capacity to set up a mental image (yid-kyi yul), they are not absolute truths about human nature, nor are they ever meant to be absolute truths. Rather, they are a kind of 'hypothesis', put forth to explain what has been found to be invariant and to facilitate further probings which take place within the person himself. As a 'hypothesis' they have a good chance of being correct (functionally true, though not representationally true) in a domain that reaches beyond the ordinary level of the relatively invariant. On the significance of the search for invariance, see "Appendix: Physics and Perception," in David Bohm, The Special Theory of Relativity.

34) Briefly mentioned in Theg-pa mtha'-dag-gi gsal-bas byed-pa Grub-pa'i mtha' rin-po-che'i mdzod, p. 367, and discussed in greater detail in Tshig-don rin-po-che'i mdzod, p. 127 f, and mKha'-'gro yang-thig, part 3, pp. 119 f.

35) mKha'-'gro yang-thig, part 2, pp. 172 f. The quotation from the Rig-pa rang-shar chen-po'i rgyud does not seem to be in the text as found in rNying-ma rgyud-'bum, vol. 10; the quotation from the Sen-ge rtsal-rdzogs chen-po'i rgyud is found in rNying-ma rgyud-'bum, vol. 9, p. 247; rNying-ma'i rgyud bcu-bdun, vol. 2, p. 257.

36) This is the term for the decisive pattern in the 'other side' as discussed in Tshig-don rin-po-che'i mdzod, pp. 127 f.

37) mKha'-'gro yang-thig, part 2, pp. 154 f.
NOTES TO CHAPTER ONE

1) Theg-pa chen-po' i man-ngag-gi bstan-bcos Yid-bzhin rin-po-che'i mdzod, p. 78; and its commentary, Padma dkar-po, pp. 827 f. It is important to note that Klong-chen rab-'byams-pa considers this practice to be preliminary to bsam-gtan.

2) sngags (gsang-sngags). See Kindly Bent to Ease Us, part 1, p. 289 n.22.

4) Padma dkar-po, p. 828.

5) gzugs-sku and chos-sku. On these terms see Kindly Bent to Ease Us, part 1, pp. 268 n.18, 276 n.10, and p. 223 in particular.

6) dpal kun-tu bzang-po-la phyag-'tshal-lo. The invocation is the same as in Kindly Bent to Ease Us, part 1. See p. 250 n.1 for Klong-chen rab-'byams-pa’s interpretation of it in the context of that work.

Inasmuch as bsam-gtan involves the whole of man in his self-development, the invocation is explained by Klong-chen rab-'byams-pa in his Ngal-gso skor-gsum-gyi spyi-don legs-bshad rgya-mtsho, pp. 108 f, as implying the following in the process of starting-point— path— goal:

As for the starting-point, dpal means self-existent pristine cognitiveness. kun-tu means the (Buddha) intentionality in which the founding strata of meaning and their founded pristine cognitions are such that they cannot be added to nor
subtracted from each other insofar as their intentionality, throughout the three aspects of time, does not step out of itself nor turn into something other than itself; and bzang-po means not to stir away from it. phyag-'tshal-lo ('Praise to') means to understand their value.

As for the path, dpal means the (Buddha) intentionality as the founding stratum of meaning in which pure awareness, the mind as limpid clearness and consummate perspicacity, is comfortably settled. kun-lu means for all eternity not to abandon its reach and range. bzang-po means that, if we do not abandon the reach and range of the founding stratum of meaning, the whole of 'appearance' and of 'mind' comes as an (amusing) play that takes place in original freedom and absolute completeness. phyag-'tshal-lo means to make efforts to make one's creative imagination reach the center of meaningfulness.

As for the goal, dpal means the primordial Lord who, having come as the (spiritual) teacher for Samsāra and Nirvāṇa, resides as the indissoluble unity of founding stratum and founded pristine cognitions in the secret chamber of our precious existence. kun-lu means to reveal the pure realm of 'Og-min with its five certainties, and bzang-po means to train the six kinds of sentient beings in their respective stations in life through the play-like manifestation of (individual) Buddhas, by means of 'great Compassion' that issues from this realm. phyag-'tshal-lo means to present our offerings joyfully and devotedly.

On the 'primordial Lord' see Kindly Bent to Ease Us, part 1, p. 290 n.2. 'Og-min may be rendered freely as 'spiritual realm', whose many facets are ways of understanding. A lengthy discussion is found in Klong-chen rab-'byams-pa's dPal gsang-ba'i snying-po de-kho-na-nyid nges-pa'i rgyud-kyi 'grel-pa phyogs-bcu'i mun-pa thams-cad rnam-par sel-ba, fol. 21a ff.

7) rgyal-'gong, name for a male mischievous spirit.
8) bsen-mo, name for a female spirit.
9) mkha'-'gro, also mkha'-'gro-ma, are positive in nature; ma-mo are negative.
10) the'u rangs, name for a male mischievous spirit.

11) gsal-dangs. There is a subtle difference between these two terms. gsal implies emission or seeming emission of light, an effulgence which, in a sense, is transfigured by light. dangs does not emit any light.

NOTES TO CHAPTER TWO

1) Shing-rta rnam-par dag-pa, p. 50.

2) It is unfortunate that both the Tibetan term bla-ma and the Sanskrit word guru have been horribly misused, be it out of ignorance or out of self-aggrandisement.

Padma-phrin-las-snying-po in his Bla-med nang rgyud-sde-gsum-gyi rgyal-chos padma'i zhag-gdams lam-rim ye-snying 'grel-pa ye-shes brjed-byang gcig-bcas ye-shes lam-'jug, p. 429, explains:

The word bla-ma stands for the Sanskrit word guru which has the two meanings of 'weighty' (heavy) and 'light' (ethereal). As there is an abundance of capabilities there is weightiness, and as there is no limitation by evil there is lightness. This meaning also applies to primordial pristine cognitiveness: 'weightiness' by virtue of capabilities because all the capabilities that constitute Buddhahood are present in completeness; and 'lightness' by virtue of the absence of defects because one's being has never been experienced as defiled by the incidental impurity that is this paradox of there being a presence where there is nothing.

From the rNyung-ma Tantras we learn that bla-ma is the totality field of experience that has as its 'cause' (the 'triggering' of) the presence in Mind-as-such (sems-nyid rgyu'i bla-ma) and finds its
'goal' (the culmination of the process) in our individual minds when operating as pristine cognitions ('bras-bu sens-kyi bla-ma, 'bras-bu yeshes bla-ma) in its 'framework of meanings as a presence' (snang-ba chos-kyi bla-ma, snang-ba chos-nyid bla-ma).

3) Shing-rta rnam-par dag-pa, p. 52.

4) As Klong-chen rab-'byams-pa concisely states in his Theg-pa mtha'-dag-gi don gsal-bar byed-pa Grub-pa'i mtha' rin-po-che'i mdzod, p. 178, the prātimokṣa comprises five kinds of persons who have already renounced or are about to renounce the world, as well as two kinds who continue to live the life of a householder. The former are a fully ordained monk or nun, a novice, male or female, having taken the vow of renunciation but not yet admitted into the order, and a person preparing himself for being admitted into the higher order; the latter are lay devotees, male and female. What distinguishes those covered by the prātimokṣa from ordinary persons is that they impose upon themselves a discipline whereby they will eventually be able to follow the path.

5) Shing-rta rnam-par dag-pa, p. 53.

6) 'Confidence' (dad-pa) is a summary term for a number of states of mind aiding a person's spiritual growth. Traditionally, three kinds are distinguished. See H. V. Guenther & Leslie S. Kawamura, Mind in Buddhist Psychology, p. 39. However, Klong-chen rab-'byams-pa in his Theg-pa chen-po'i man-ngag-gyi bstan-bcos Yid-bzhin rin-po-che'i mdzod, pp. 62-65, and his commentary on it, the Padma dkar-po, pp. 744-62, distinguishes six kinds and arranges them as follows: eagerness, curiosity, dedication, clarity, trust, and pursuit of one's objective with cer-
tainty and in certitude." Of them, curiosity, dedication, and clarity fall under 'lucid confidence' in the traditional scheme, interest and trust under 'trusting confidence', and the pursuit of one's objective with certainty and in certitude is the very implementation of 'longing confidence' or eagerness in Klong-chen rab-'byams-pa's redefinition. Thus he says:

Eagerness makes a person accept or reject according to the relationship that exists between cause and effect; Curiosity makes a mind apply itself to the most high; Dedication makes a person most conscientious; Clarity lets virtue shine brightly in the mind; Trust abolishes doubt about the real meaning of life; And pursuit of one's objective with certainty and in certitude is to have supreme confidence in the most high,

As it emerges when one listens to (its exposition), ponders (its meaning), and brings it to life in one's own being.

Klong-chen rab-'byams-pa then discusses each kind of confidence as to its nature, definition, subdivision, appropriate illustration, and indication of its presence in an individual. Once confidence is present in a person, it does the following for him:

Confidence is like the fertile soil. As the foundation of all that is, it increases the amount of what is wholesome and healthy.

It is like a boat crossing the river of fictitious being. It is like an escort protecting against (spiritual) death and emotional assault.

It is like a carriage travelling to the island of freedom. It is like the king of all jewels, making whatever one intends to come true. It is like a hero, crushing evil.

It is the most precious hoard amongst the worthwhile accumulations.

But where there is no confidence, there is no chance whatsoever to grow and to escape from one's self-imposed limitations.
In those who have no chance (to win freedom), there is no confidence whatsoever. 
Deficiency in confidence knows no bounds.  
It is like the bottomless boundless sea: nowhere can the dry land of freedom be found.  
It is like a ship without a steersman, which will never set (its passengers) free from fictitious being.  
It is like a person with maimed hands who has arrived (at the land of gold), but has no chance to clothe himself in what is wholesome and healthy.  
It is like a burnt seed, which will not grow the sprout of limpid clearness and consummate perspicacity.  
It is like a blind person, for whom there is no light to see.  
It is like someone who has been thrown into the dungeon of Samsāra, and can but move about in Samsāra. 

Klong-chen rab-'byams-pa then goes on to discuss the ways and means of generating confidence and making it gain in strength, as well as the circumstances under which it may wane.

7) In his Shing-ria rnam-par dag-pa, p. 50, Klong-chen rab-'byams-pa likens perseverance and the desire to escape from one’s present situation to the soil; the feeling of disgust with one’s situation to the going out into the field; the concern with liberation to the seed to be planted which eventually will grow into the desired fruit of limpid clearness and consummate perspicacity; the dismissing of thoughts concerned with this life only to the field work; and the looking forward to the harvest—the tending of the inner capabilities—to manure.

8) The basic text, as well as its reproduction in Shing-ria rnam-par dag-pa have brian ‘teaching’ instead of brian ‘firmness’. But in his explanation on p. 50, Klong-chen rab-'byams-pa makes no reference to ‘teaching’, but speaks of ‘a firm mind’ (blo-brtan).

9) In Shing-ria rnam-par dag-pa, p. 52, Klong-chen rab-'byams-pa states that the Śrāvaka abides by the rules of the prātimokṣa in order to find his answer to life’s problems. The Bodhisatva, that is, ethical man, extends his search for life’s meaning over
three ‘countless aeons’, which is to say that while the Śrāvaka acts on the egoistic principle, ethical man acts on the benevolent principle. The mystic attempts to find the answer in his lifetime by the realization that these two principles operate in a wider field, and it is this field that is of sole importance.

10) That the three obligations belong to one and the same person is the theme of mNga’-ris pandita Padma dbang-gyi rgyal-po’s (1487–1542) Rang-bzhin rdogs-pa chen-po’i lam-gyi cha-lag sdom-pa gsum rnam-par nges-pa, to which Lo-chen Dharma-sri (1654–1717) of smIn-grol-gling wrote the famous commentary, sDom-gsum ‘grel-pa legs-bsad ngo-mtshar dpag-bsam-gyi ste-mo. The sDom-gsum rnam-par nges-pa’i sman-’grel rig-pa ‘dzin-pa’i ‘jugs-ngogs, by a certain Gu-na (on p. 279), quotes Klong-chen rab-byams-pa’s words.

11) In his Theg-pa mtha’-dag-gi gsal-bar byed-pa Grub-pa’i mtha’ rin-po-che’i ma’grol, p. 188, Klong-chen rab-byams-pa elaborates on Mahāyānottaratantrasastra, I, 157, in which it is plainly stated that self-denigration is an impediment to spiritual growth.

**NOTES TO CHAPTER THREE**

1) Theg-pa chen-po’i man-ngag-gi bstan-bcos Yid-bzhin rin-po-che’i ma’grol, p. 78, and its commentary, Padma dkar-po, p. 829, where Klong-chen rab-byams-pa adds: ‘In the same way as a sprout grows due to many causes and conditions, so also the growth of this pristine cognitiveness will not come about just because it exists within us, but it needs many actions (appropriate to its growth).’ It is scarcely necessary to emphasize that thabs never means ‘random activity’.

2) Shing-ria rnam-par dag-pa, pp. 74 f: “The meaning of the word (dbang derives from) abhisēka and śikata (sic!), to wash off dirt and to assign a certain portion. Further, one speaks of empowerment because of the power to link up with the vision of truth on the first spiritual level, in this one’s lifetime."

In the Khyad-par chos-spyod-kyi khrid-rim lam-rim ‘od-kyi phreng-ba (in Bla-ma dgongs-pa ’dus-pa, vol. 5 [in Ngagyur Nyigsmay...
three etymologies are offered. The one which is derived from *abhigiśika* is connected with 'cleaning', "in the same way as a vessel that has been thoroughly cleansed is fit to have liquids poured into it." The one derived from *abhigikata* (sic!) is connected with 'assigning a portion', "in the same way as a father gives an allowance to his son." The one derived from *abhisisii* (sic!) is connected with 'maturation' "in the same way as a king makes his ministers and subjects accept his orders."

There is quite a variety of rituals that go with what is implied by the term *dbang*, and this has the effect that the names for these 'empowerments' may be similar in the context in which they occur, but their content is quite different in each case. This is clearly stated by Yon-tan rgya-mtsho in his *Zab-don snang-byed nyi-ma'i 'od-zer*, p. 100.

In rDzogs-chen practice the *dbang* refers to intrapsychic processes.

Lastly, the order of these empowerments involves a hierarchy in the 'founding' (*rten*) and the 'founded' (*brten*) which on the surface is the body-mind complex.

3) This is clearly stated by Yon-tan rgya-mtsho in his *Zab-don snang-byed nyi-ma'i 'od-zer*, pp. 185, 190, 192.

4) In his *Theg-pa miha'-dag-gi don gsal-bar byed-pa Grub-pa'i miha' rin-po-che'i mdzod*, p. 372, Klong-chen rab-'byams-pa even goes so far as to state:

Although it has been said that attention to and cultivation of the Developing and Fulfillment Stages are of primary importance on the ordinary way of self-growth, they have to be dismissed because they do not lead beyond subjective speculation. But on this uncommon way here, the pristine cognitiveness that is sheer lucency is seen directly, beyond all subjective operations concerning mental constructs.

He goes on to stress the point that the real aim of 'meditation' is to become free from the restrictive operations of the mind, the noetic-noematic complex which cannot but operate within its limitations, and to make the 'jump' to 'pristine cognitiveness' which is inclusive as it involves a whole world-outlook.
5) This variety of terms reflects the difficulty of trying to name or talk about the totality field of experience, because it is impossible to make ostensive definitions. Primarily, these terms indicate the shift of viewpoint which has carried with it freedom from old concerns and a wider vision and perspective that has been so startling that it has to be talked about. Maybe the most difficult terms are *rig-*pa and *lhan-*cig-*skyes-*pa. The former, although for want of a better term rendered as ‘pure awareness’, is far from implying anything static or merely receptive. It is ‘informative’ without having recourse to concepts, and it is ‘ecstatic’ in being the highest form of pleasurable excitement when the currents (*rlung*, ‘motility’) are so strong that the person has the feeling of being ‘lit up’, ‘radiating light’ (*gsal-*ha) like a star, which is due to the bioenergetic input flowing at its optimum capacity. The latter (*lhan-*cig-*skyes-*pa) indicates that the totality field of experience is always with us in its totality and completeness, and insofar as it is so, it is a ‘setting’ (*bsam-*glim). Most of the terms occur together in Klong-chen rab-*byams-*pa’s *Theg-*pa *chen-*po’i man-ngag-*gi* *bsTan*-bo*os Yid-*bcin rin-po-*che’i* mdzod, pp. 79ff, and he explains them in the *PhaDma ilkar-*po, pp. 939 f:

The pristine cognitiveness in wider perspective, having come about through the above technique, is such that in its reach and range of radiance and pleasure there is nothing about it of presence or non-presence; the inner glow, passing beyond words that have to do with such indices as that it is something existing or not existing or that it is this or is not this, is a pure awareness, defying all propositions, shining in pellucidity and radiance; it is like the orbs of sun and moon, steady in their pellucidity and radiance in the range that is not broken up and has no sectors, like the sky.

Free from the mire of divisive concepts, it is like the ocean. In this self-existent pristine cognitiveness, Mind-as-such, sheer lucency, always attend to and bring to life that which is with and in you,
The founding stratum of meaning, directly encountered by worthy persons.

In his commentary on this part, Klong-chen rab-'byams-pa gives a very personal account by referring to the words of his teacher and by stating that he found his own experiences supported by the texts:

In this state where, when I attended to motility, the pure awareness in its radiance was without concepts, and when I attended to the bioenergetic input, the pure awareness in its pleasure was radiant, I looked intently at this pure awareness in myself. Even in this barest (experience of) pleasure, radiance, and non-dividedness (by concepts), there was nothing of presence or non-presence. In the pure facticity of the pure awareness within me, radiant and open, there was nothing of it being this or not being this or of existing or not existing. This pure awareness, in which its very value of being beyond words and thought, indescribable by analogies, has disappeared, was like an ocean, pellucid and steady; it was like the orbs of sun and moon, having no ideas about themselves in their radiance; it was like the wider expanse of the sky, unbroken and not falling into partiality. This pure awareness in each of us, in which the agitation of mind and mental events has subsided, is encountered as the founding stratum of meaning, Mahāmudrā, self-existent pristine cognitiveness, and it is said to be rDzogs-pa chen-po, Madhyamika, the essence of the six topics of (Nāropa's) techniques, the very nature of the Path-and-the-Goal, the Zhi-byed (system) by which all agitatedness subsides, the Prajñāpāramitā dealing with the meaning of the experience of Being.

The freedom that comes with the shift of perspective is well described in the subsequent verse:

Whatever concepts with their ostensible designations may arise
Do so freely in this reach and range of the experience of Being, like the waves in a river.
It is important not to let slip this pellucidity in its relaxed state.
Klong-chen rab-'byams-pa explains this verse to mean:

When one attends to this state that is like the ocean, deep, calm, with no expanding and no contracting, there may arise concepts trying to move to the object; do not run after them so as to capture them rising, do not repress their being; when they have subsided by themselves and there is relaxation, do not let slip this pellucidity that has come through previous attention to it. Concepts are like waves, they will subside by themselves in the reach and range of sheer lucency. Because they have come from Mind-as-such and will untangle themselves in it, they are no different from it.

He then goes on to describe that which will lead to 'higher cognitions':

Attend to self-existent pristine cognitiveness that is with you,
(In which) value-cognition is an incessant stream because (its) setting has become pellucid,
There occurring no depression, no gloominess, no elation,
No attachment, no striving, free from every movement.
This is the instruction in the most profound.

He explains this passage to imply the following:

Whenever one engages in contemplative attention when either motility or the bioenergetic input level or the pure awareness is happily settled in itself, one has to attend in such a way that the cognitive capacity does not become depressed or gloomy, that dividing concepts do not rush forth, that one does not become attached to the sensations in this contemplation, that one does not move away from this state, that the circulation of breath is not felt, and that the separation of pellucidity from radiance is not vitiated by the intrusion of dividing concepts. That is to say, selective and discursive thinking, attachment to the feelings of joy and pleasure, and attention to respiratory movements are defects of the contemplative setting. Since breathing is a rushing forth, it is the vehicle of dividing concepts and is hence declared to be a defect. Thus, when one is in this range that is radiant from deep within, value-cognitions
proceed in an uninterrupted stream because they are inseparable from that appreciative cognition that is a self-existent sheer lucency. This one has to attend to constantly.

From all this we can gather that the transition must come freely and that it cannot be forced. Hence, the reference to breathing does not mean to stop breathing or to hold one’s breath for a period of time, but ordinary ‘shallow’ breathing as the vehicle for the rush of concepts must change over into a different rhythm. The reference to selective and discursive thinking and what follows is a description of the phases of ‘meditation’ (dhyāna) found in the canonical texts. This kind of ‘meditation’ which remains within the subject-object dichotomy, is quite different from ‘rDzogs-chen meditation’. Unfortunately, the same term (bsam-gtan) is used for both forms.

6) Shing-ria nram-par dag-pa, p. 81. ‘Non-dividedness’ (mi-rtog-pa) is a short-hand term for a process that can be paraphrased only at some length. rtog-pa indicates the first step in the direction of conceptualization (rnam-par rtog-pa) by introducing a split in the continuum of experience as a dynamic field. The field itself has no ‘split’ (rtog-med). Therefore, mi-rtog-pa suggests non-interference with the continuum. Interference (rtog-pa) is to divide unity into a curiously mosaic pattern in which each configurative element is taken separately.

7) This ‘thrust towards Being’ (de-bzhin gshegs-pa’i snying-po in the parlance of speculative-philosophical works, and bde-bar gshegs-pa’i snying-po in that of the ‘existential’ approach to man’s problem) is referred to by two other terms as long as it operates in a living being. The one, rigs, indicates the ‘affinity with Being’ which takes on various forms individually; the other, khams, indicates the ‘bioenergetic level’ and is basically operational. As such, these terms specifically indicate the quality of either an ordinary sentient person or a more advanced person such as ‘ethical man’. They are used figuratively only with respect to someone who has reached the Buddha-level. Klöng-chen rab-byams-pa discusses this problem most lucidly in his Theg-pa mtha’-dag-gi don gsal-bar byed-pa Grub-pa’i mtha’ rin-po-che’i mdzod, pp. 167, 173, 183.
8) ge'i rgyud. This term refers to the primacy of Being, of which both an ordinary sentient being and a Buddha is an 'explication'. Being as a continuum is implied by the use of this term rgyud with reference to either 'explication'. Being-(as-such) therefore reverberates in the concrete being of an individual as he understands (or fails to understand) himself. See Theg-pa'i mchog rin-po-che'i mdzod, I, p. 177. As Klong-chen rab-'byams-pa concisely states in his Theg-pa mtha'-dag-gi don gsal-bar byed-pa Grub-pa'i mtha' rin-po-che'i mdzod, p. 386, this ge'i rgyud is 'self-existent pristine cognitiveness'.

9) Theg-pa'i mchog rin-po-che'i mdzod, I, pp. 547 f.
In his mKha'-yong yan-tig, part 2, p. 161, Klong-chen rab-'byams-pa explains the term ye-shes-kyi rlung ('motility as the carrier of pristine cognitiveness') as follows:

ye-shes-kyi rlung is the name of pure awareness that comes from 'responsiveness' (in the triadic pattern of Being). Since this triad of facticity, actuality, and responsiveness is indivisible, it is (for this reason that it is operationally) termed 'pristine cognitiveness'. Since in its mere stirring, in its mere flashing, it is similar to the breeze of the wind, it is called 'motility'. Motility in the concrete refers to the emergence of the noetic-noematic complex which is its pathway. The effulgence of pristine cognitiveness as a mere flash is carried away by the horse of motility and becomes the many consciousness-patterns. The ye-shes-kyi rlung is, in its facticity, an utter openness and hence defies any limitations by propositions; as to actuality, it is radiance and hence manifests itself as founding stratum and founded pristine cognitions; as to responsiveness, it is pure awareness and hence arises as a pristine cognitiveness that is an overall sensitivity and a pristine cognitiveness that is sensitive to detailed observable qualities.

He then goes on to criticize severely those who do not understand that 'motility' has quite different connotations in different situations because there is a great difference between 'pristine cognitiveness' (ye-shes) and the 'noetic-noematic complex' (sems), engrossed in its constructs that lead to karmic consequences.
10) The Developing Stage and the Fulfillment Stage, which must enter the unity of experience, rather than remain separate exercises.

11) According to Klong-chen rab-'byams-pa’s Zab-mo yung-tig, part 1, pp. 193 ff, the following refers to specific methods of reinstating the state of non-dividedness, aided by attention to ‘mobility’, the energetic currents (rtung) as they flow along the ‘conductors’ (rtsa), and to the ‘bioenergetic input’ (thig-le) which is felt to be pervasive of the whole organism.

12) *bdud-rtsi*. ‘Nectar’ is the term found in dictionaries which offer little help when one deals with technical matters. In rDzogs-chen thought *bdud-rtsi* refers to a process of transformation or transfiguration. The word is analyzed into its components *bdud*, used to cover all that we could term ‘constructs of the mind’, ‘the darkness that comes with a decline in pure awareness’, ‘the straying into the triple world’, ‘the poison of emotions’, ‘the mind in its state of roaming in the triple world’, ‘the sentient being in Samsāra’, and so on, and *rtsi*, used to indicate the opposites such as ‘founding stratum of meaning in which no dividing concepts occur’, ‘absolute pristine cognitiveness’, ‘the return from having strayed into Samsāra’, and so on. See sNang-srid-kha-sbyor *bdud-rtsi bcud-thig ‘khor-ba thog-mtha’ gcod-pa’i rgyud phyi-ma* (in rNyin-ma rgyud-bum, vol. 6, pp. 1–52), pp. 3 ff.

Ngag-dbang bstan-dzin rdo-rje, in his Klong-chen snying-gi thig-le’i mkha’-gro bde-chen rgyal-mo’i sgrub-gzhung-gi ’grel-pa rgyud-don snang-ba, pp. 30 ff, quotes from the bDud-rtsi sgrong-gsal to the effect that “Samsāra, resembling *bdud* (Māra, the personification of spiritual death), is painted (*rtsi* biang) with absolute pristine cognitiveness, and hence one speaks of *bdud-rtsi*.” He goes on to give further examples of these hermeneutical interpretations which are based on certain experiences.

13) In the basic text Klong-chen rab-'byams-pa speaks of ‘pellucidity’ (doungs), but in the commentary the term rang-bzhin, ‘as such’, ‘as it actually is there’, is used.

14) The sky (nam-nkha) is used here as a symbol for unlimited expansion which is hierarchically ordered. To the extent that (‘objectively’) the external reference is lost and gives way to an utter openness that is yet radiant in its immediately felt presence (stong-gsal phyi'i nam-nkha), there is internally (‘subjectively’) a vastness that is not limited by dividing concepts (riod-med rang-gi nam-nkha), and this merges in a totality field and is understood as pure (naked) cognitiveness that is ‘informative’ (rig) and an utter openness (stong). Shing-ria nman-par dag-pa, p. 90.

When irritation-aversion is born in the mind, it is like the start of fierce, wild winter storms; when desire-attachment is born it is like water rushing downhill; when dullness-lusterlessness is born it is like fog thickening; when arrogance is born it is like the wind fighting with rocks; and when envy-jealousy is born it is like water rushing down a ravine.

16) In his Shing-ria nman-par dag-pa, pp. 93 f, Klong-chen rab-'byams-pa illustrates each of the three indicators (pleasure, radiance, non-dividedness) in their ‘entropic’ character, by ten instances, five of which tend to make each indicator an end in itself and to have it pursued purely ‘subjectively’ as if it could be ‘possessed’, so that the person pursuing it is ‘obsessed with’ it. Five other instances are the obverse of the above over-evaluations.
17) In his *Shing-ria rnam-par dag-pa*, pp. 94 f, Klong-chen rab-byams-pa states that it is easy to mend any deficiency by its appropriate counteragent, but it remains a sort of patchwork. Most important is to go to the very root whence the deficiency has started, that is, to realize that whatever there is, positive or negative, is the play of 'pure awareness' (*rig-pa*), the ultimate source of our being, which in its play is 'positive' when we go along with it, but 'negative' when we try to go against it.

18) As Klong-chen rab-byams-pa states in his *Shing-ria rnam-par dag-pa*, p. 98, this is the theme of the third part of his trilogy and is detailed in the commentary on it.

19) *rdo-rje'i bum-pa* is a term referring to the 'energy body' (*rdo-rje'i lus*). The syllabic sound symbol ལོ རོ མོ ལོ རོ མོ connects this 'reservoir' with the central 'conductor' which, in turn, is a 'link' with the totality of Being.

20) This refers to the 'foundation' for living beings, as it evolved in the self-evolution of the cosmos. It had its origin through the cosmic 'wind' that caused clouds to gather and to pour down their rain forming an ocean on which the 'earth' came into existence. See *Padma dkar-pa*, p. 45.

21) A Tantra belonging to the Kriya division. It is the basic Tantra in the Japanese Shingon sect.

22) In his *Shing-ria rnam-par dag-pa*, p. 107, Klong-chen rab-byams-pa, in support of this statement, quotes from the sGyu-phrul dra-ba. But his quotation is not in the Tantra that goes by this name. The translation of the various ingredients is only tentative. The specific connotations of the general terms vary from district to district.

23) It is at this stage that a process can be initiated that has most often been misunderstood. In his *Shing-ria rnam-par dag-pa* pp. 108 f, Klong-chen rab-byams-pa distinguishes between *phyag-rgya*(ma) and *rig-ma*, where he defines the latter as *yid-gi rig-ma*, thus emphasizing that the process described in the following passage, in spite of its ostensible sexual character,
actually is a psychic (imaginative) process that owes much to 'internalization'. The motions that are described indicate that the whole person is actively engaged in the revitalization by a seemingly sexual excitation. In his Theg-pa'i mchog rin-po-che'i mdzod, I, p. 301, Klong-chen rab-'byams-pa states that rig-ma means the following:

**rig-pa** is so called because the pristine cognition that comes from pure awareness is known directly, and **ma** means that since there is nobody in the world who does not depend on a mother (ma), there is no emergence of Buddhahood without its dependence on a **rig-ma** who is like the earth.

And on p. 302 he explains **phyag-rgya-ma** as follows:

**phyag** is 'to hold', that is, to hold (a person) away from Samsāra and on to the level of Buddhahood. **rgya** is 'to seal', that is, to seal Samsāra with limpid clearness and consummate perspicacity; **ma** means that this is similar to vital food. In the same way as there is death when there is no food, so there cannot come any understanding (of Being) without its dependence on a **phyag-rgya-ma**, and when this understanding does not come, there is bondage in the triple world.

It seems that, at Klong-chen rab-'byams-pa's time, misunderstanding of what was actually involved was as rampant as it is still today in the Western world which has the added disadvantage of being caught in the 'literalist's' fallacy whenever non-Western source material is involved. Again and again, throughout his works, Klong-chen rab-'byams-pa emphasizes the distinctness of the rDzogs-chen approach to life's meaning from the other techniques, and there is a veiled contempt for those of 'low intelligence'. See Lung- gi gter-mdzod, 105a ff; Tshig-don rin-po-che'i mdzod, pp. 134 ff.

There are essentially two attitudes involved, the one is concerned with the 'what' and hence emphasizes 'techniques' to such a degree that everything else is intentionally ignored. This is the obsession with sex, to give only one example, and it figures predominantly in the realm of the thabs-lam ('procedure by techniques'). The other is the attitude of him who 'stands above' and is concerned with the 'how'. This is the grol-lam...
('procedure in and through freedom'). Klong-chen rab-byams-pa is a representative of the grol-lam.

24) In his Shing-rta n'am-par dag-pa, p. 112, Klong-chen rab-byams-pa adds that the important point is to know what it is all about, and that to go through such motions as detailed above in a repeat performance is of no avail, but rather a path on which all one's efforts are merely wasted away.

25) As Klong-chen rab-'byams-pa in his Shing-rta n'am-par dag-pa, p. 113, clearly states, these techniques never go beyond the subjective level concerned with its objective reference, thus maintaining the dividedness that is to be overcome.

26) The Zhi-byed system goes back to the teaching of the Indian master Dam-pa sangs-rgyas, a pupil of Maitripta. In Tibet Dam-pa sangs-rgyas became the teacher of the remarkable woman Ma-gcig lab-sgron-ma (1055–1145) whose gCod system is still alive today. Mahâmudrâ is the leitmotif of the teachings of the Indian Mahâsiddhas and was developed in Tibet by the bKa’-brgyud-pa school. Prâjñâpâramitâ, "the method to reach the other shore by the development of discriminative appreciation," and Mâdhyamika, "pursuing a middle course," refer to the traditional epistemological and argumentative approaches respectively.

Other Dharma Publishing Books

*The Voice of the Buddha*, the first complete English translation of the Lalitavistara Sutra, the Buddha’s own account of his life and actions. Basic, inspiring reading for students of all Dharma traditions, phrased in exquisite prose and verse.

*The Marvelous Companion*, by Aryasura. 34 exemplary tales drawn from accounts of the Buddha’s previous lives convey the power of generosity, patience, truthfulness, and compassion.

*Dhammapada*, a fresh new translation of the Buddha’s essential teaching on twenty-six topics, with Tibetan text, wordlist, and Tibetan/Sanskrit/English glossary.

*The Life and Liberation of Padmasambhava* by Yeshe Tsogyal. This treasure-text of the Nyingma tradition conveys insights into the nature of the Great Guru and the Vajrayana teachings.

*Calm and Clear* by Lama Mipham. Translations of two traditional guides to meditation by a brilliant 19th-century Tibetan master show how to build a stable, rewarding practice.

*Gesture of Balance, a Guide to Self-healing, Awareness and Meditation*, by Tarthang Tulku. Intimate discussions and effective techniques support confidence, inner honesty, and the will to change.

If you order Dharma books directly from the publisher, it will help us to make more such books available. Write for a free catalogue and new book announcements.

Kindly Bent to Ease Us

MEDITATION, the second volume of Longchenpa’s Trilogy of Finding Comfort and Ease, introduces a central practice of Dzogchen, the Teachings of the Great Perfection. The form of meditation presented here by the 14th-century rNying-ma lama revered as an ‘all-knowing’ master is considered the pinnacle of all Buddhist meditative traditions, the “king of all instructions.” Its purpose is to liberate us from mind’s restrictive operations, and reveal the unparalleled radiance of awareness. The experience of this meditation is like the sun emerging from the clouds; it fills the mind with light and transforms the practitioner’s understanding.

In three richly poetic chapters, Longchenpa first describes the environments most conducive to attaining inner calm and a wide perspective. Next he outlines the qualities useful for individuals wishing a more meaningful life. Finally, he distills the essence of the instruction, guiding the meditator to realize ‘pure awareness’, the pristine quality of mind which reveals itself to us naturally when the agitation of words and concepts ceases, and we engage “an experience as open as the sky.”

In presenting this carefully annotated translation, Herbert V. Guenther, outstanding scholar, professor, and pioneer in Tibetan Buddhist studies in the West, has drawn extensively from Longchenpa’s own commentary, which describes how to activate fine, subtle energies and direct them toward the transformation of consciousness.
